1 Antibiotic derivatives

1.1 Ciprofloxacin derivative

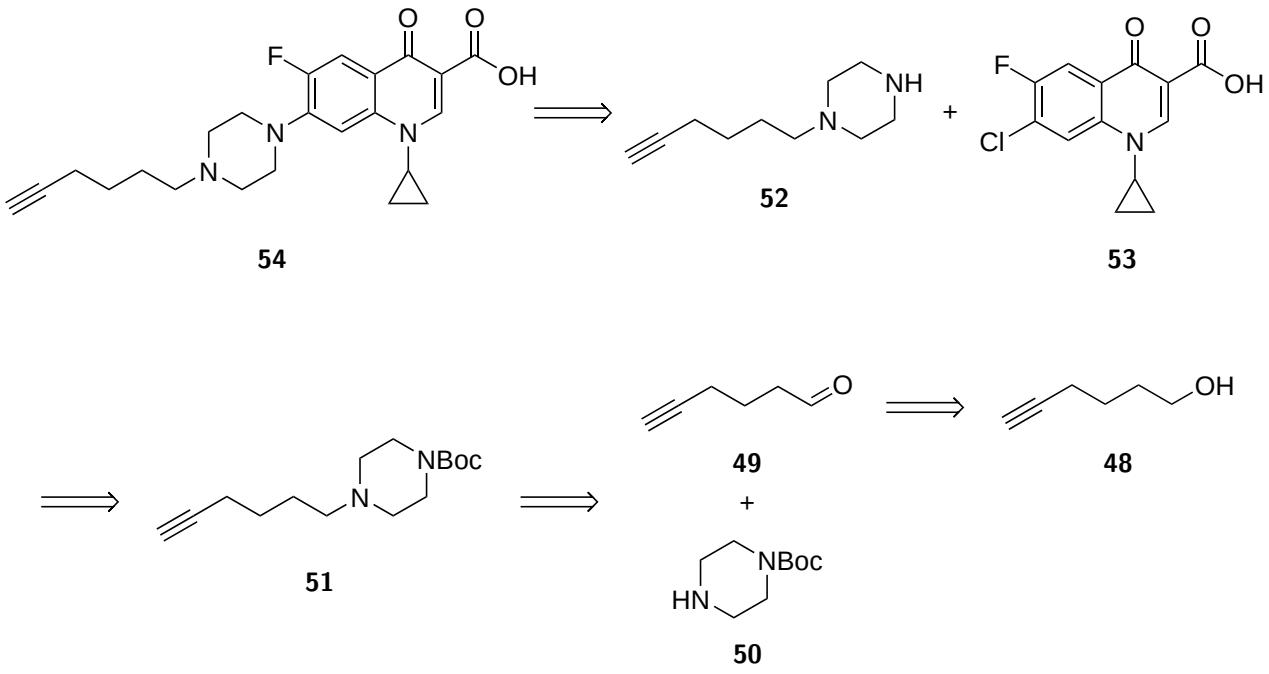
put intro in intro

1.1.1 Retrosynthesis of ciprofloxacin derivative 54

The retrosynthesis of ciprofloxacin derivative **54** is shown in Scheme 1. The disconnection to an alkynyl piperazine **54** and a commercially available ciprofloxacin precursor **53** was chosen based on a study by Renau *et al.*, who found this route to be "...superior to previous reports which involved alkylation of piperazine with an appropriate alkyl halide.".[1,2]

It was envisaged that the alkynyl piperazine **54** could be prepared from mono-Boc-protected piperazine **50** and hex-5-ynal **49** using conditions similar to those used by Renau *et al.*[1]

Unlike the aldehydes and ketones used by Renau *et al.*,[1] hex-5-ynal **49** is not commercially available and so it was hoped that this could be prepared by oxidation of hex-5-ynol **48**.



Scheme 1: The retrosynthesis of **54**.

1.1.2 Synthesis of ciprofloxacin derivative 54

Hex-5-ynal **49** was prepared by PCC oxidation of hex-5-ynol **48** in good yield according to the procedure described by Kocsis *et al.*[3]

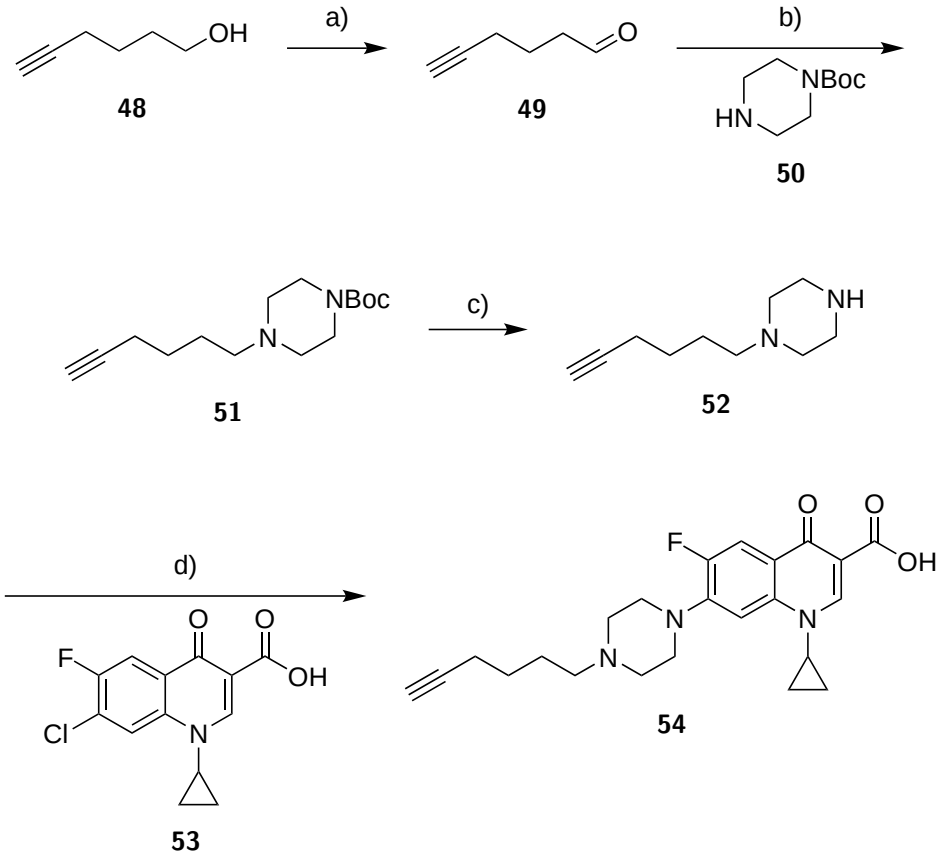
Renau *et al.*[1] used sodium cyanoborohydride to facilitate the reductive amination of hex-5-ynal **49** and 1-Boc-piperazine **50**. However, it was decided to attempt this transformation using the less toxic sodium triacetoxyborohydride following a procedure reported by Abdel-Magid *et al.*[4] This reaction yielded compound **51** in excellent yield, which was deprotected using TFA using the procedure described by Renau *et al.*[1] to give the alkynyl piperazine **52** quantitatively.

The alkynyl piperazine **52** was refluxed in MeCN with the ciprofloxacin precursor **53** according to the procedure described by Renau *et al.*,[1] however the reaction did not proceed. Addition of 2 eq. of NEt_3 did not lead to reaction, however it was found that refluxing in neat NEt_3 led to conversion to the final ciprofloxacin derivative **54**.

With a small sample of the final product in hand, less harsh conditions were sought for a larger-scale version of the final reaction. Mircowave irradiation at 115 °C was used, following a procedure by Reddy *et al.*[5] DMSO and NMP were tested as solvents, with or without the addition of TEA. The reactions were monitored using LCMS, and NMP without TEA was found to give the highest conversion.

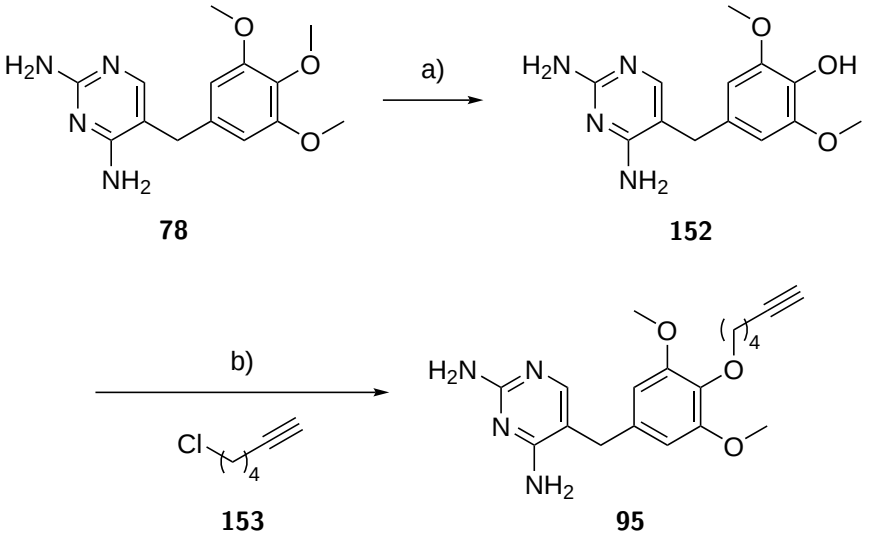
Work-up of this reaction proved difficult, with an unknown dark brown viscous liquid being formed which was difficult to separate from the white solid product. A pure sample was obtained by recrystalisation from EtOAc, but the yield was rather poor (11.8 %). The reaction was observed to stall after a certain point, while still having some of the ciprofloxacin precursor **53** present. The alkynyl piperazine **52** was not observed by TLC despite having been added in two-fold excess, suggesting that it degraded to a by-product before having chance to react.

Further attempts to refine this reaction might involve lower temperatures, higher ratios of the alkynyl piperazine **52** or improvement of the purification, e.g. by finding better precipitation conditions or by using reverse-phase chromatography. A Buchwald-Hartwig coupling or Ullmann reaction could also be attempted, but, as seen later, coordination of ciprofloxacin to Cu can hinder catalysis.



Scheme 2: The synthesis of **54**. a) Pyridinium chlorochromate, CH_2Cl_2, r.t., 5 h, 72 %. b) $NaBH(AcO)_3$, 1,2-dichloroethane, r.t., 10.5 h, 99 %. c) TFA, r.t., 1 h, 100 %. d) NMP, microwave, 115 °C 24 h, 11.8 %.

1.2 Trimethoprim derivative



Scheme 3: The synthesis of **95**.

Meldrum's acid (9.0 g, 63 mmol, 1 eq.) was dissolved in anhydrous CH_2Cl_2 (150 ml) in an oven-dried flask and cooled to 0 °C. Pyridine (10.2 ml, 126 mmol, 2 eq.) was added dropwise over 20 min. Octanoyl chloride (11.7 ml, 69 mmol, 1.1 eq.) was then added and the mixture was stirred at 0 °C for a further 4 h. The mixture was allowed to warm to r.t., diluted with CH_2Cl_2 (20 ml) and poured into a mixture of ice (~30 g) and HCl (2 N, 90 ml). The solution was washed with NaCl (sat., aq., 150 ml) and dried over $MgSO_4$. The solvent was removed under vacuum to give an orange-brown oil. The oil was refluxed in anhydrous MeOH (150 ml) for 5 h and the solvent was removed under vacuum. The resulting residue was purified by column chromatography (SiO_2, 5 % Et_2O/40-60 P.E.). A tautomeric mixture of **21** and **22** was obtained as a colourless oil (8.34 g, 41.6 mmol, 66 %, 92 % **21** as determined by ^{1}H NMR).

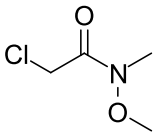
1.7 Heptyl magnesium bromide 28

Magnesium turnings (352 mg, 14.5 mmol, 1 eq.) were added to an oven-dried flask under argon. THF (15 ml) was added, followed by bromoheptane (2.40 ml, 14.5 mmol, 1 eq.) dropwise. The mixture was stirred at r.t. for 2 h followed by heating to reflux for 2 h to give the Grignard reagent as a pale grey suspension (15 ml, ~ 1 M) which was used without further purification.

1.8 2-Chloro-*N*-methoxy-*N*-methylacetamide 30



N,*O*-Dimethylhydroxyl amine hydrochloride (6.00 g, 61.5 mmol, 1 eq.) and toluene (75 ml) were added successively to a stirred solution of potassium carbonate (22.4 g, 162 mmol, 2.63 eq.) in water (75 ml) at 0 °C under argon. The mixture was cooled to - 5 °C and chloroacetyl chloride (5.88 ml, 73.8 mmol, 1.20 eq.) was added dropwise over 5 min. The mixture was allowed to warm to r.t. over 30 min, then the organic layer was separated and the aqueous layer was extracted with toluene (3×20 ml). The combined organic extracts were dried with $MgSO_4$ and the solvent was removed by rotary evaporation followed by high vacuum. **30** was obtained as white, prism-like crystals (7.24 g, 52.6 mmol, 71 %).

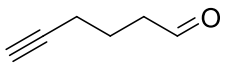
1.20 Hex-5-ynal 49



Pyridinium chlorochromate (14.6 g, 68.1 mmol, 1.50 eq) and DCM (500 ml) were stirred at r.t. under argon. 5-hexyn-1-ol **48** (5.00 ml, 45.4 mmol, 1 eq.) was added and the reaction mixture was stirred for 5 h followed by addition of Et_2O (125 ml) and silica gel (62.5 g). The suspension was stirred for 1 h then filtered through a pad of silica (100 g) and washed with Et_2O. The solvent was removed by rotary evaporation. **49** was obtained as a pale yellow-green oil (4.72 g, 49.1 mmol, 72 %).

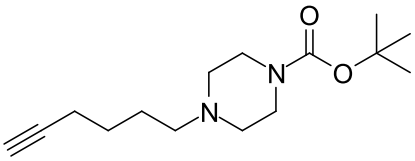
IR (neat) ν_{max} / cm^{-1} = 3292.7 (alkyne C-H), 2943.3 (alkane C-H), 2830.9 (aldehyde C-H), 2728.6 (aldehyde C-H), 1720.3 (aldehyde C=O)

^{1}**H NMR** (400 MHz, $CDCl_3$) δ / ppm = 9.80 (s, 1 H, C(=O)$\underline{H}$), 2.60 (t, J = 7.1 Hz, 2 H, C$\underline{H}_2$C(=O)H), 2.26 (dt, J = 2.6, 6.8 Hz, 2 H, HC≡CC$\underline{H}_2$), 1.98 (t, J = 2.7 Hz, 1 H, $\underline{H}$C≡C), 1.85 (quin, J = 7.0 Hz, 2 H, HC≡CCH$_2$C$\underline{H}_2$)

^{13}**C NMR** (101 MHz, $CDCl_3$) δ / ppm = 201.6 ($\underline{C}$(=O)), 83.1 (HC≡$\underline{C}$), 69.3 (H$\underline{C}$≡C), 42.4 ($\underline{C}$H$_2$C(=O)), 20.7 ($\underline{C}$H$_2$CH$_2$C(=O)), 17.6 (HC≡C$\underline{C}$H$_2$)

Spectroscopic data are consistent with the literature.[3]

1.21 *tert*-Butyl 4-(hex-5-yn-1-yl)piperazine-1-carboxylate 51



Hex-5-ynal **49** (0.407 g, 4.24 mmol, 1.00 eq.) and *tert*-butyl piperazine-1-carboxylate (0.791 g, 4.24 mmol, 1.00 eq.) were stirred under a N_2 atmosphere in 1,2-dichloroethane (20 ml) for 2.5 h followed by addition of sodium triacetoxyborohydride (6.25 g, 29.5 mmol, 6.96 eq.) in four portions over 4 d. The mixture was stirred for a further day then $NaHCO_3$ (sat., aq., 120 ml) was added and the product extracted with EtOAc (2×100 ml). The solvent was dried over $MgSO_4$ and removed by rotary evaporation. **51** was obtained as a colourless liquid (1.12 g, 4.21 mmol, 99 %).

TLC R_f (10 % MeOH/CH_2Cl_2) = 0.55

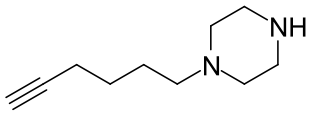
HRMS (ESI$^+$) m/z / Da = 267.2073, $[M+H]^+$, $[C_{15}H_{27}N_2O_2]^+$ requires 267.2064

The compound has not been reported previously.

1.22 1-(Hex-5-yn-1-yl)piperazine 52



tert-Butyl 4-(hex-5-yn-1-yl)piperazine-1-carboxylate **51** (763 mg, 2.86 mmol) was stirred in TFA (10 ml) at r.t. for 2 h. The TFA was removed under vacuum followed by co-evaporation with CH_2Cl_2 (2×20 ml). The oil was diluted with H_2O (10 ml) and the pH adjusted to 14 with NaOH (10 % aq.). This mixture was extracted with CH_2Cl_2 (2×20 ml) and the combined organic layers were dried over $MgSO_4$. The solvent was removed under vacuum and purified by column chromatography (SiO_2 MeOH/CH_2Cl_2 3:7). **52** was obtained as a colourless liquid (476 mg, 2.86 mmol, 100 %).

TLC R_f (30 % MeOH/CH_2Cl_2) = 0.20

IR (neat) ν_{max} / cm^{-1} = 3295.9 (alkyne C-H), 2941.1 (alkane C-H), 2810.6 (alkane C-H), 1637.2 (N-H bend)

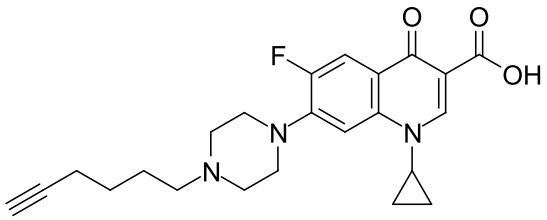
^{13}C NMR (101 MHz, $CDCl_3$) δ / ppm = 84.3 ($HC{\equiv}\underline{C}$), 68.4 ($H\underline{C}{\equiv}C$), 58.6 ($CH_2CH_2\underline{C}H_2N$), 54.5 ($CH_2CH_2CH_2N(\underline{C}H_2)\underline{C}H_2$), 46.0 ($CH_2CH_2CH_2N(CH_2\underline{C}H_2)CH_2\underline{C}H_2$), 26.4 ($CH_2\underline{C}H_2CH_2N$), 25.7 ($HC{\equiv}CCH_2\underline{C}H_2$), 18.3 ($HC{\equiv}C\underline{C}H_2$)

HRMS (ESI$^+$) m/z / Da = 167.1548, $[M+H]^+$, $[C_{10}H_{19}N_2]^+$ requires 167.1548

The compound has not been reported previously.

1.23 1-Cyclopropyl-6-fluoro-7-(4-(hex-5-yn-1-yl)piperazin-1-yl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid 92



7-Chloro-1-cyclopropyl-6-fluoro-4-oxo-1,4-dihydroquino-line-3-carboxylic acid **53** (1.27 g, 4.51 mmol, 1 eq.), 1-(hex-5-yn-1-yl)piperazine **52** (1.5 g, 9.02 mmol, 2 eq.) and *N*-methyl-2-pyrrolidone (10 ml) were stirred in a microwave reactor at 115 °C for 24 h. The reaction mixture was cooled to r.t. and water (80 ml) was added. The mixture was stirred for 3 h and then filtered, and residue was washed with MeOH (50 ml). The resulting solid (0.571 g) was further purified by recrystalisation from EtOAc (50 ml). **92** was obtained as off-white crystals (0.219 g, 0.531 mmol, 11.8 %).
