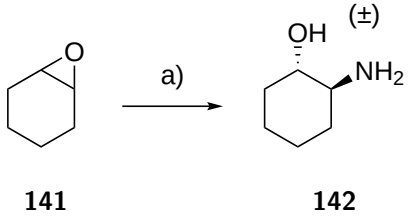
0.1 Cyclohexanol derivatives

0.1.1 Synthesis of the *trans*-2-aminocyclohexan-1-ol head group

It was decided to produce the cyclohexanol conjugates racemically, with the option of re-synthesising enantiomerically pure versions via the route shown in **??** if the compounds showed biological activity.

Production of the cyclohexanol conjugates began with the synthesis of *trans*-2-aminocyclohexan-1-ol **142** (see Scheme 1), using a procedure reported by Xue et al.[18] Cyclohexene oxide **141** was opened using ammonia in water and methanol. Initially the reaction was carried out at 85 °C in a microwave reactor for 30 min, but a large amount of the disubstituted amine could be seen by LCMS (in a ratio of 4:3 product to impurity by NMR). The reaction was therefore attempted at room temperature, and proceeded overnight in high yield and with minimal side reaction.



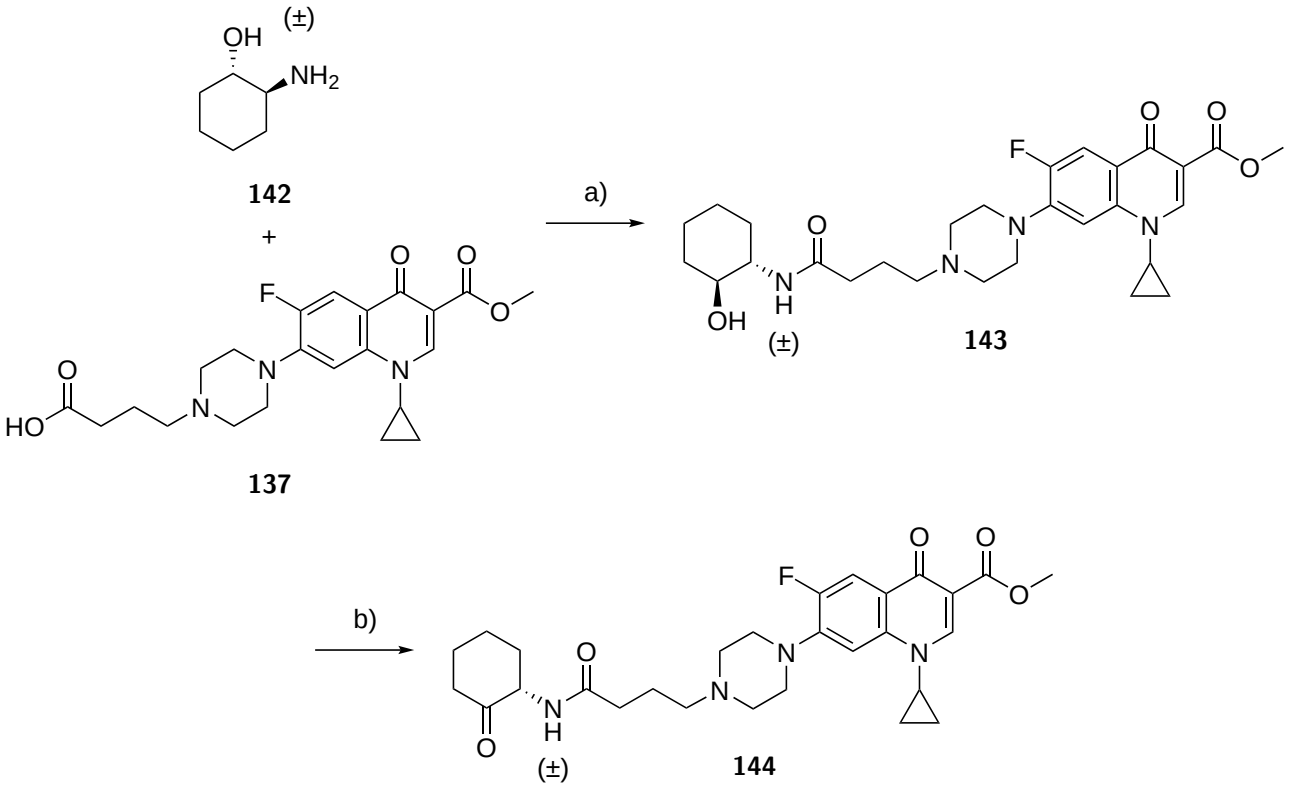
141 **142**

Scheme 1: Synthesis of *trans*-2-aminocyclohexan-1-ol **142**. a) NH_3, water, MeOH, r.t., 72 h, 86.2 %.

0.1.2 Synthesis of the *trans*-cyclohexanol- and cyclohexanone-CipMe conjugates

Carboxylic acid **137** was coupled with *trans*-2-aminocyclohexan-1-ol **142** using standard peptide coupling conditions to give *trans*-cyclohexanol-CipMe conjugate **143** in 31.7 % yield. Again, losses during purification appear to be the main cause of this poor yield.

A portion of the *trans*-cyclohexanol-CipMe conjugate **143** was then oxidised to the ketone using Dess-Martin periodinane. The product was isolated in good yield, perhaps due to the compound being less polar and hence easier to purify.

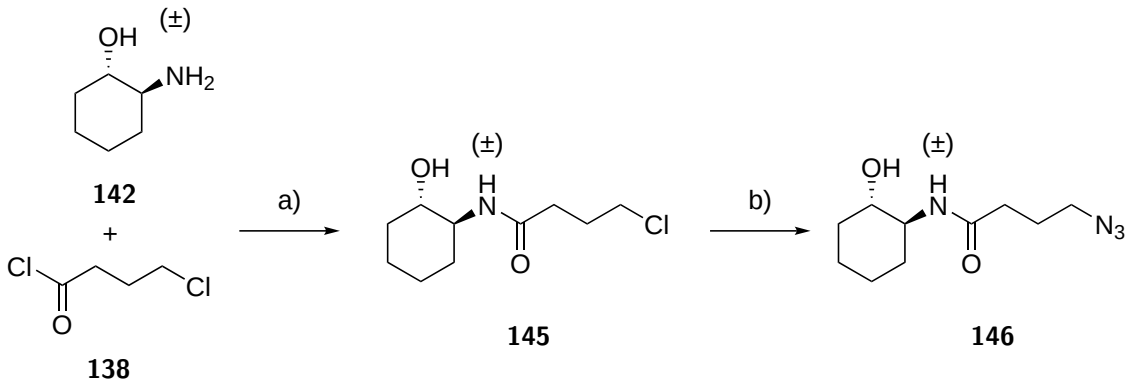


Scheme 2: Synthesis of the cyclohexanol-CipMe conjugate **143** and the cyclohexanone-CipMe conjugate **144**. a) EDC, HOBt, DIPEA, DMF, r.t., 16 h, 31.7 %. b) DMP, CH_2Cl_2, r.t., 6 h, 69.1 %.

0.1.3 Synthesis of the *trans*-cyclohexanol- and cyclohexanone-Cip triazole conjugates

The triazole conjugates were synthesised using the route described in . Cl-C_4-*trans*-cyclohexanol **145** was synthesised in good yield from *trans*-2-aminocyclohexan-1-ol **142** and 4-chlorobutyryl chloride **138**.

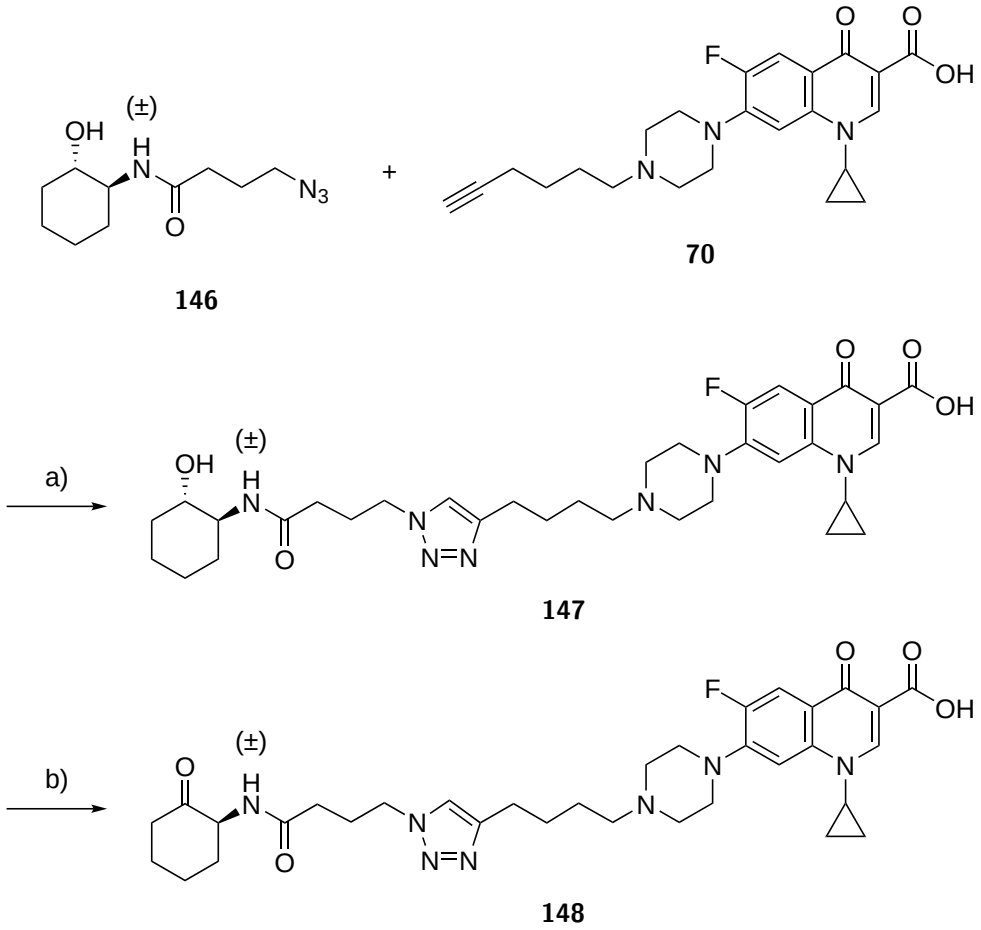
Cl-C_4-*trans*-cyclohexanol **145** was then converted to N_3-C_4-*trans*-cyclohexanol **146** by reaction with sodium azide in excellent yield.



Scheme 3: Synthesis of N_3-C_4-*trans*-cyclohexanol **146**. a) TEA, CH_2Cl_2, 0 °C, 30 min, 76.1 %. b) NaN_3, acetonitrile, 50 °C, 16 h, 97.5 %.

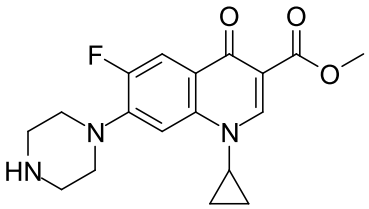
The *trans*-cyclohexanol-Cip triazole conjugate **147** was synthesised using standard click conditions (see **??**) in 48.9 % yield.

A portion of the *trans*-cyclohexanol-Cip triazole conjugate **147** was then oxidised to the ketone using the same conditions used for the cyclohexanone-CipMe conjugate (see 0.1.2) in very good yield.



Scheme 4: Synthesis of the *trans*-cyclohexanol-Cip triazole conjugate **147** and the cyclohexanone-Cip triazole conjugate **148**. a) $CuSO_4$, THPTA, sodium ascorbate, H_2O, *t*-BuOH, r.t., 16 h, 48.9 %. b) DMP, CH_2Cl_2, r.t., 4 h, 78.0 %.

0.2 Methyl 1-cyclopropyl-6-fluoro-4-oxo-7-(piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylate 92



Ciprofloxacin **28** (10.0 g, 30 mmol, 1 eq.) and *p*-toluenesulfonic acid (8.60 mg, 44.5 mmol, 1.5 eq.) were refluxed in methanol (500 ml) for 72 h. The mixture was cooled to room temperature and $NaHCO_3$ (sat., aq., 100 ml) and water (300 ml) were added. The product was extracted with CH_2Cl_2 (2×400 ml). The combined organic fractions were dried over $MgSO_4$ and evaporated under reduced pressure. **92** was obtained as a white amorphous solid (9.16 g, 26.5 mmol, 83.3 %).

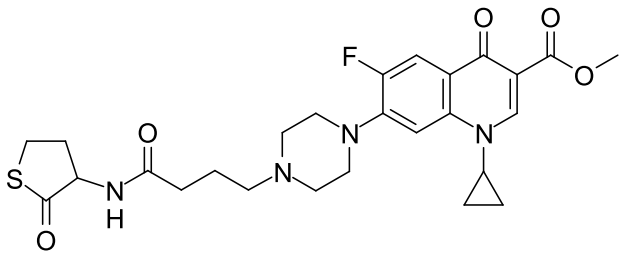
HRMS (ESI^+) The compound does not ionise.

works in LCMS see Lois283

The compound has been synthesised previously[11,12] but characterisation was not published.

0.4 Methyl 1-cyclopropyl-6-fluoro-4-oxo-7-(4-(4-oxo-4-((2-oxotetrahydrothiophen-3-yl)amino)butyl)piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylate 95



Methyl 1-cyclopropyl-6-fluoro-4-oxo-7-(piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylate **92** (50 mg, 0.145 mmol, 1 eq.), 4-bromo-*N*-(2-oxotetrahydrothiophen-3-yl)butanamide **94** (34.5 mg, 0.145 mmol, 1 eq.) and K_2CO_3 (20 mg, 0.145 mmol, 1 eq.) were stirred in acetonitrile (2 ml) at 50 °C under argon. After 24 h a further portion of **94** (34.5 mg, 0.145 mmol, 1 eq.) was added. After another 24 h a further portion was added (69.0 mg, 0.290 mmol, 2 eq.). After another 24 h the temperature was raised so the mixture was at reflux. After a final 24 h the precipitate was filtered off and the filtrate was purified by column chromatography (SiO_2, 5-10 % $MeOH/CH_2Cl_2$) followed by preparative HPLC (5-95 % acetonitrile/water over 20 min). **95** was obtained as a cream-coloured amorphous solid (9.4 mg, 0.018 mmol, 12.2 %).

TLC R_f = 0.47 (10 % $MeOH/CH_2Cl_2$)

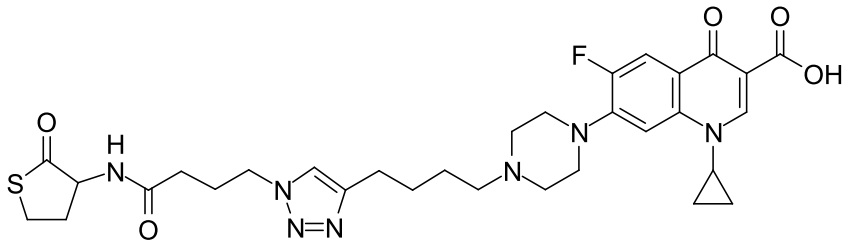
0.6 1-Cyclopropyl-6-fluoro-4-oxo-7-(4-(4-(1-(4-oxo-4-((2-oxotetrahydrothiophen-3-yl)amino)butyl)-1*H*-1,2,3-triazol-4-yl)butyl)piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid 97



1-Cyclopropyl-6-fluoro-7-(4-(hex-5-yn-1-yl)piperazin-1-yl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid **70** (15 mg, 36.7 μmol, 1 eq.) and 4-azido-*N*-(2-oxotetrahydrothiophen-3-yl)butanamide **96** (12.5 mg, 55.1 μmol, 1.5 eq.) were dissolved in 1:9:10 water/*t*-BuOH/DMSO (3 ml), and the mixture was degassed by bubbling N_2 through it. A solution of $CuSO_4$ and THPTA (182 μl, 18.2 μmol, 0.5 eq. 100 mM, aq.) was added, followed by a solution of sodium ascorbate (367 μl, 36.7 μmol, 1 eq., 100 mM, aq.). The mixture was stirred at r.t. under argon for 4 d. Water (10 ml) and 10 % *i*-PrOH/$CHCl_3$ (10 ml) were added, the organic layer was separated and the aqueous layer was extracted again with 10 % *i*-PrOH/$CHCl_3$ (2×10 ml). The combined organic layers were dried with $MgSO_4$ and evaporated under reduced pressure. The residue was purified by preparative HPLC (5-95 % acetonitrile/water over 20 min). The combined pure fractions were evaporated under reduced pressure and then partitioned between $NaHCO_3$ (aq., sat., 50 ml) and 10 % *i*-PrOH/$CHCl_3$ (50 ml). The organic layer was dried with $MgSO_4$ and evaporated under reduced pressure. **97** was obtained as a white amorphous solid (16.5 mg, 25.9 μmol, 70.6 %).

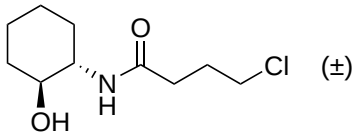
0.36 4-Chloro-*N*-((*trans*)-2-hydroxycyclohexyl)butanamide 145



(*trans*)-2-Aminocyclohexan-1-ol **142** (1.04 g, 9.03 mmol, 1 eq.), TEA (1.65 ml, 1.20 g, 11.8 mmol, 1.3 eq.) and CH_2Cl_2 (50 ml) were stirred at 0 °C. 4-Chlorobutyryl chloride **138** (1.22 ml, 1.54 g, 10.9 mmol, 1.2 eq.) was added dropwise over 5 min. The mixture was stirred at 0 °C for 30 min, then water (50 ml) was added. The organic layer was separated off, and the aqueous layer was extracted with 10 % *i*-PrOH/$CHCl_3$ (2×50 ml). The combined organic layers were dried with $MgSO_4$, concentrated under reduced pressure and purified by column chromatography (SiO_2, 0-100 % EtOAc/Et_2O). The combined organic fractions were dried with $MgSO_4$ and evaporated under reduced pressure. **145** was obtained as white needles (1.51 g, 6.87 mmol, 76.1 %).

TLC R_f = 0.19 (Et_2O)

mp T / °C = 72.5-75.7 (*i*-PrOH, $CHCl_3$)
