

The synthesis and biological evaluation of a library of
autoinducer-antibiotic conjugates

Lois Overvoorde

Sidney Sussex College

University of Cambridge

June 2016

Supervised by Prof. David Spring

A dissertation submitted to the University of Cambridge in partial fulfilment of the
requirements for the Certificate of Postgraduate Studies

Contents

1 Nomenclature	7
2 Autoinducer-antibiotic conjugates	10
2.1 Introduction	10
2.1.1 Azido autoinducer derivatives	10
2.1.2 Alkynyl antibiotic derivatives	11
2.1.3 Autoinducer-antibiotic conjugates	12
2.2 Azido autoinducer derivatives	12
2.2.1 Synthesis of 6-N ₃ -HHQ 40	12
2.2.2 Synthesis of 6-N ₃ -PQS 51	13
2.2.3 Synthesis of the azido C ₄ -HSL derivatives 57 , 60 and 63	15
2.3 Alkynyl antibiotic derivatives	16
2.3.1 Synthesis of the alkynyl ciprofloxacin derivative 70	16
2.3.2 Synthesis of the alkynyl trimethoprim derivative 73	17
2.4 Triazole-linked autoinducer-antibiotic conjugates	18
2.4.1 Optimisation of the click reaction	18
2.4.2 Synthesis of the autoinducer-ciprofloxacin and autoinducer-trimethoprim triazole conjugates	19
2.4.3 Synthesis of homoserine lactone-ciprofloxacin triazole conjugates with cleavable linkers .	24
3 Autoinducer analogue-ciprofloxacin conjugates	25
3.1 Introduction	25
3.1.1 Inspiration	25
3.1.2 Head groups	26
3.1.3 Linkers	28
3.2 Homocysteine thiolactone derivatives	29
3.2.1 Synthesis of methyl ciprofloxacin 102	29
3.2.2 Synthesis of Br-C ₄ -HCTL 104	29
3.2.3 Synthesis of the HCTL-CipMe conjugate 105	29
3.2.4 Synthesis of the HCTL-Cip triazole conjugate 107	30
3.2.5 Synthesis of the cleavable HCTL-Cip triazole conjugate 108	31
3.3 2-Methoxybenzene derivatives	31
3.3.1 Synthesis of Br-C ₄ -2-methoxybenzene 110	31
3.3.2 Synthesis of the 2-methoxybenzene-CipMe conjugate 111	31
3.3.3 Synthesis of the 2-methoxybenzene-Cip triazole conjugate 113	32
3.4 3-Methoxybenzene derivatives	33
3.4.1 Synthesis of Br-C ₄ -3-methoxybenzene 115	33
3.4.2 Synthesis of the 3-methoxybenzene-CipMe conjugate 116	33
3.4.3 Synthesis of the 3-methoxybenzene-Cip triazole conjugate 118	34
3.5 Cyclopentanol derivatives	35
3.5.1 Synthesis of the 2-aminocyclopentan-1-ol head groups 123 and 124	35
3.5.2 Initial branching route	36
3.5.3 TBDMS protection route	38
3.5.3.1 Synthesis of TBDMS-protected (1 <i>S</i> ,2 <i>S</i>)-2-aminocyclopentan-1-ol 123	39
3.5.3.2 Synthesis of Br-C ₄ -cyclopentanol-TBDMS-(<i>SS</i>) 136	40
3.5.3.3 Synthesis of N ₃ -C ₄ -cyclopentanol-TBDMS-(<i>SS</i>) 138 by one-pot reaction	41

3.5.3.4	Synthesis of the (<i>SS</i>)-TBDMS-cyclopentanol-Cip triazole conjugate 142	41
3.5.4	Synthesis of the cyclopentanol-CipMe conjugates 129 and 130 by peptide coupling	42
3.5.5	Synthesis of the cyclopentanol-Cip triazole conjugates 132 and 133 via chloride intermediates	44
3.6	Cyclohexanol derivatives	47
3.6.1	Synthesis of the <i>trans</i> -2-aminocyclohexan-1-ol head group 151	47
3.6.2	Synthesis of the <i>trans</i> -cyclohexanol- and cyclohexanone-CipMe conjugates 152 and 153	48
3.6.3	Synthesis of the <i>trans</i> -cyclohexanol- and cyclohexanone-Cip triazole conjugates 156 and 157	48
4	Experimental	50
4.1	General	50
4.2	Methyl 3-oxodecanoate 35	51
4.3	Methyl (<i>E</i>)-3-((4-((<i>tert</i> -butoxycarbonyl)amino)phenyl)amino)dec-2-enoate 38	52
4.4	6-Amino-2-heptylquinolin-4-ol 39	52
4.5	6-Azido-2-heptylquinolin-4-ol 40	53
4.6	Heptyl magnesium bromide 42	54
4.7	2-Chloro- <i>N</i> -methoxy- <i>N</i> -methylacetamide 45	54
4.8	1-Chlorononan-2-one 46	54
4.9	2-Oxononyl 2-amino-5-nitrobenzoate 48	55
4.10	6-Nitro-2-heptyl-3-hydroxyquinolin-4(1 <i>H</i>)-one 49	56
4.11	6-Amino-2-heptyl-3-hydroxyquinolin-4(1 <i>H</i>)-one 50	56
4.12	6-Azido-2-heptyl-3-hydroxyquinolin-4(1 <i>H</i>)-one 51	57
4.13	(<i>S</i>)-3-Aminodihydrofuran-2(3 <i>H</i>)-one hydrobromide 54	58
4.14	(<i>S</i>)-2-Bromo- <i>N</i> -(2-oxotetrahydrofuran-3-yl)acetamide 56	58
4.15	(<i>S</i>)-2-Azido- <i>N</i> -(2-oxotetrahydrofuran-3-yl)acetamide 57	59
4.16	(<i>S</i>)-4-Bromo- <i>N</i> -(2-oxotetrahydrofuran-3-yl)butanamide 59	60
4.17	(<i>S</i>)-6-Bromo- <i>N</i> -(2-oxotetrahydrofuran-3-yl)hexanamide 62	60
4.18	(<i>S</i>)-6-Azido- <i>N</i> -(2-oxotetrahydrofuran-3-yl)hexanamide 63	61
4.19	Hex-5-ynal 65	62
4.20	<i>tert</i> -Butyl 4-(hex-5-yn-1-yl)piperazine-1-carboxylate 67	62
4.21	1-(Hex-5-yn-1-yl)piperazine 68	63
4.22	1-Cyclopropyl-6-fluoro-7-(4-(hex-5-yn-1-yl)piperazin-1-yl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid 70	64
4.23	4-((2,4-Diaminopyrimidin-5-yl)methyl)-2,6-dimethoxyphenol 71	65
4.24	5-(4-(Hex-5-yn-1-yloxy)-3,5-dimethoxybenzyl)pyrimidine-2,4-diamine 73	65
4.25	Optimised general procedure for the click reaction	66
4.26	(<i>S</i>)-1-Cyclopropyl-6-fluoro-4-oxo-7-(4-(4-(1-(2-oxo-2-((2-oxotetrahydrofuran-3-yl)amino)ethyl)-1 <i>H</i> -1,2,3-triazol-4-yl)butyl)piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid 74	66
4.27	(<i>S</i>)-1-Cyclopropyl-6-fluoro-4-oxo-7-(4-(4-(1-(4-oxo-4-((2-oxotetrahydrofuran-3-yl)amino)butyl)-1 <i>H</i> -1,2,3-triazol-4-yl)butyl)piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid 79	68
4.28	(<i>S</i>)-1-Cyclopropyl-6-fluoro-4-oxo-7-(4-(4-(1-(6-oxo-6-((2-oxotetrahydrofuran-3-yl)amino)hexyl)-1 <i>H</i> -1,2,3-triazol-4-yl)butyl)piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid 80	69
4.29	1-Cyclopropyl-6-fluoro-7-(4-(4-(1-(2-heptyl-4-oxo-1,4-dihydroquinolin-6-yl)-1 <i>H</i> -1,2,3-triazol-4-yl)butyl)piperazin-1-yl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid 82	70
4.30	(<i>S</i>)-4-(4-(4-((2,4-Diaminopyrimidin-5-yl)methyl)-2,6-dimethoxyphenoxy)butyl)-1 <i>H</i> -1,2,3-triazol-1-yl)- <i>N</i> -(2-oxotetrahydrofuran-3-yl)butanamide 86	71

4.31 (<i>S</i>)-6-(4-(4-((2,4-Diaminopyrimidin-5-yl)methyl)-2,6-dimethoxyphenoxybutyl)-1 <i>H</i> -1,2,3-triazol-1-yl)- <i>N</i> -(2-oxotetrahydrofuran-3-yl)hexanamide 87	72
4.32 6-(4-(4-((2,4-Diaminopyrimidin-5-yl)methyl)-2,6-dimethoxyphenoxybutyl)-1 <i>H</i> -1,2,3-triazol-1-yl)-2-heptylquinolin-4(1 <i>H</i>)-one 89	73
4.33 2-(6-(4-(4-((2,4-Diaminopyrimidin-5-yl)methyl)-2,6-dimethoxyphenoxybutyl)-1 <i>H</i> -1,2,3-triazol-1-yl)hexyl)-3-hydroxyquinolin-4(1 <i>H</i>)-one 91	74
4.34 Methyl 1-cyclopropyl-6-fluoro-4-oxo-7-(piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylate 102	75
4.35 4-Bromo- <i>N</i> -(2-oxotetrahydrothiophen-3-yl)butanamide 104	76
4.36 Methyl 1-cyclopropyl-6-fluoro-4-oxo-7-(4-(4-oxo-4-((2-oxotetrahydrothiophen-3-yl)amino)butyl)piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylate 105	76
4.37 4-Azido- <i>N</i> -(2-oxotetrahydrothiophen-3-yl)butanamide 106	77
4.38 1-Cyclopropyl-6-fluoro-4-oxo-7-(4-(4-(1-(4-oxo-4-((2-oxotetrahydrothiophen-3-yl)amino)butyl)-1 <i>H</i> -1,2,3-triazol-4-yl)butyl)piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid 107	78
4.39 1-Cyclopropyl-6-fluoro-4-oxo-7-(4-(((4-(1-(4-oxo-4-((2-oxotetrahydrothiophen-3-yl)amino)butyl)-1 <i>H</i> -1,2,3-triazol-4-yl)butanoyl)oxy)carbonyl)piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid 108	79
4.40 4-Bromo- <i>N</i> -(2-methoxyphenyl)butanamide 110	80
4.41 Methyl 1-cyclopropyl-6-fluoro-7-(4-(4-((2-methoxyphenyl)amino)-4-oxobutyl)piperazin-1-yl)-4-oxo-1,4-dihydroquinoline-3-carboxylate 111	81
4.42 4-Azido- <i>N</i> -(2-methoxyphenyl)butanamide 112	82
4.43 1-Cyclopropyl-6-fluoro-7-(4-(4-(1-(4-((2-methoxyphenyl)amino)-4-oxobutyl)-1 <i>H</i> -1,2,3-triazol-4-yl)butyl)piperazin-1-yl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid 113	83
4.44 4-Bromo- <i>N</i> -(3-methoxyphenyl)butanamide 115	84
4.45 Methyl 1-cyclopropyl-6-fluoro-7-(4-(4-((3-methoxyphenyl)amino)-4-oxobutyl)piperazin-1-yl)-4-oxo-1,4-dihydroquinoline-3-carboxylate 116	85
4.46 4-Azido- <i>N</i> -(3-methoxyphenyl)butanamide 117	86
4.47 1-Cyclopropyl-6-fluoro-7-(4-(4-(1-(4-((3-methoxyphenyl)amino)-4-oxobutyl)-1 <i>H</i> -1,2,3-triazol-4-yl)butyl)piperazin-1-yl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid 118	86
4.48 (1 <i>S</i> ,2 <i>S</i>)-2-(((<i>S</i>)-1-Phenylethyl)amino)cyclopentan-1-ol 121 and (1 <i>R</i> ,2 <i>R</i>)-2-(((<i>S</i>)-1-phenylethyl)amino)cyclopentan-1-ol 122	88
4.49 (1 <i>S</i> ,2 <i>S</i>)-2-Aminocyclopentan-1-ol 123	89
4.50 (1 <i>R</i> ,2 <i>R</i>)-2-Aminocyclopentan-1-ol 124	90
4.51 4-Azido- <i>N</i> -((1 <i>S</i> ,2 <i>S</i>)-2-hydroxycyclopentyl)butanamide 127	90
4.52 4-Azido- <i>N</i> -((1 <i>R</i> ,2 <i>R</i>)-2-hydroxycyclopentyl)butanamide 128	91
4.53 Methyl 1-cyclopropyl-6-fluoro-7-(4-(4-(((1 <i>S</i> ,2 <i>S</i>)-2-hydroxycyclopentyl)amino)-4-oxobutyl)piperazin-1-yl)-4-oxo-1,4-dihydroquinoline-3-carboxylate 129	92
4.54 Methyl 1-cyclopropyl-6-fluoro-7-(4-(4-(((1 <i>R</i> ,2 <i>R</i>)-2-hydroxycyclopentyl)amino)-4-oxobutyl)piperazin-1-yl)-4-oxo-1,4-dihydroquinoline-3-carboxylate 130	93
4.55 Methyl (<i>S</i>)-1-cyclopropyl-6-fluoro-4-oxo-7-(4-(4-oxo-4-((2-oxocyclopentyl)amino)butyl)piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylate 131	94
4.56 1-Cyclopropyl-6-fluoro-7-(4-(4-(1-(4-((1 <i>S</i> ,2 <i>S</i>)-2-hydroxycyclopentyl)amino)-4-oxobutyl)-1 <i>H</i> -1,2,3-triazol-4-yl)butyl)piperazin-1-yl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid 132	95
4.57 1-Cyclopropyl-6-fluoro-7-(4-(4-(1-(4-((1 <i>R</i> ,2 <i>R</i>)-2-hydroxycyclopentyl)amino)-4-oxobutyl)-1 <i>H</i> -1,2,3-triazol-4-yl)butyl)piperazin-1-yl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid 133	96
4.58 (1 <i>S</i> ,2 <i>S</i>)-2-((<i>tert</i> -Butyldimethylsilyl)oxy)cyclopentan-1-amine 134	97
4.59 4-Azido- <i>N</i> -((1 <i>S</i> ,2 <i>S</i>)-2-((<i>tert</i> -butyldimethylsilyl)oxy)cyclopentyl)butanamide 138	98

2 Autoinducer-antibiotic conjugates

2.1 Introduction

The first part of this project was focused on producing a library of autoinducer-antibiotic conjugates with the hope of increasing the potency of the antibiotics and possibly restoring their action against resistant strains of bacteria. *P. aeruginosa* autoinducers were used, in particular C₄-HSL **2**, HHQ **5** and PQS **4** (see Figure 1). Azido derivatives of these compounds were coupled to alkynyl dervitatives of antibiotics, specifically ciprofloxacin **28** and trimethoprim **30** (see Figure 2), using a copper(I)-catalysed azide-alkyne cycloaddition.^{1,2}

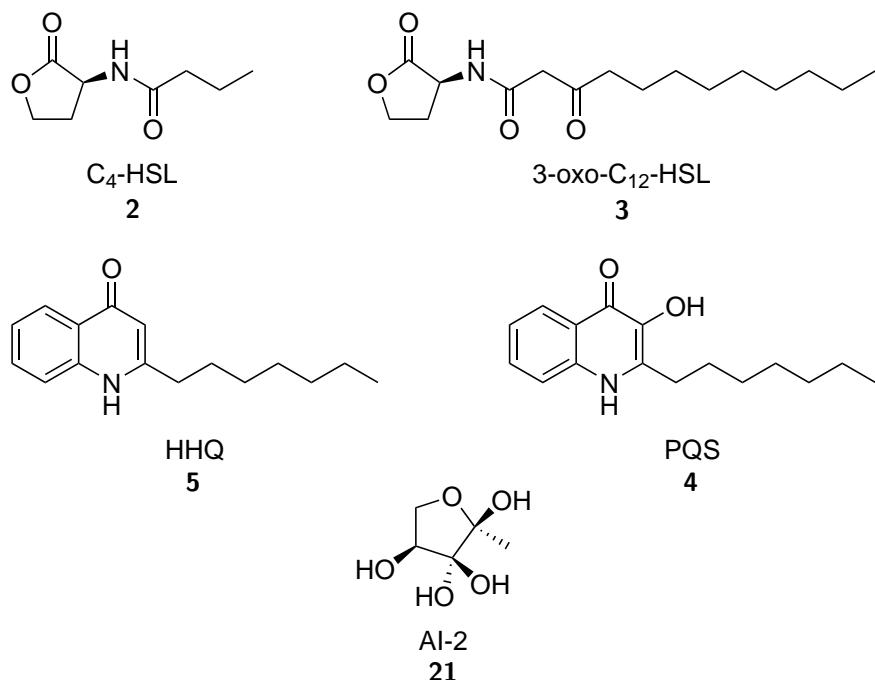

Figure 1: The *P. aeruginosa* autoinducers.

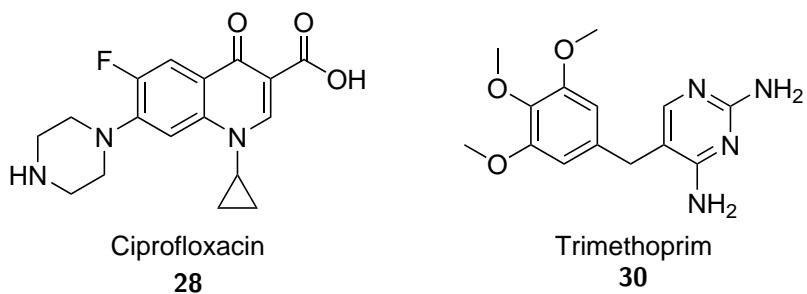

Figure 2: The antibiotics used in this project.

2.1.1 Azido autoinducer derivatives

The structure-activity relationships in HHQ **5** and PQS **4** have been previously studied,^{3–5} and it was shown various substitutions on the benzene ring could be made without significantly decreasing activity. The 6-azido derivatives (see Figure 3) were chosen for this study as routes to them have previously been found.⁶

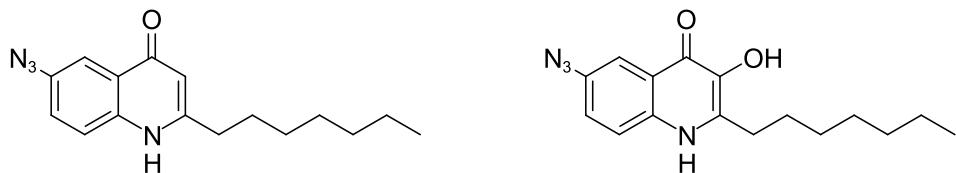

Figure 3: The azido derivatives of HHQ **5** and PQS **4**: **40** and **51**.

Alteration of the lactone group of C₄-HSL **2** and other HSL derivatives is known to significantly decrease activity, especially where the number of H-bond donors or acceptors is altered.⁷ Hence, the azide group was included on the tail of C₄-HSL **2**. Acyl tail length is known to play an important role in affinity, so three derivatives of C₄-HSL **2** were synthesised: N₃-C₂-HSL **57**, N₃-C₄-HSL **60** and N₃-C₆-HSL **63** (see Figure 4).

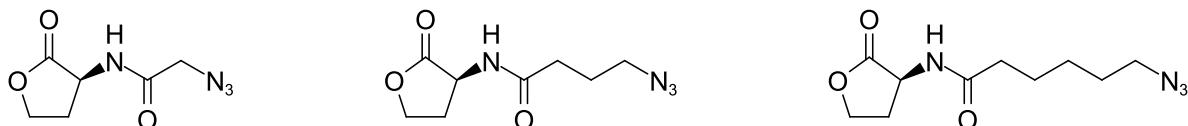

Figure 4: The azido derivatives of C₄-HSL **2**: **57**, **60** and **63**.

2.1.2 Alkynyl antibiotic derivatives

Ciprofloxacin **28** (see Figure 2) is second-generation fluoroquinolone antibiotic used to treat both Gram-positive and Gram-negative bacterial infections including *P. aeruginosa*.⁸ The structure-activity relationships for ciprofloxacin have been investigated⁹ and modifications at the cyclopropane and piperazine groups were found not to cause loss of activity. It was decided an alkyne tail would be added onto the free NH of the piperazine ring, as this position is more synthetically accessible. Alkynyl ciprofloxacin derivative **70** (see Figure 5) was synthesised in this study (see 2.3.1), and two cleavable alkynyl ciprofloxacin derivatives **92** and **93** were synthesised by Dr Eddy Sotelo and combined with some of the azido HSL derivatives made in this study (see 2.2.3 and 2.4.3).

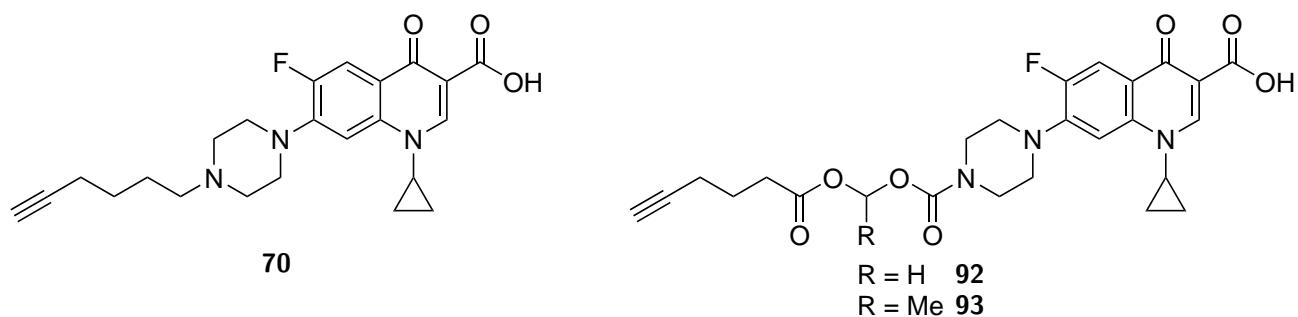

Figure 5: The alkynyl ciprofloxacin derivatives **70**, **92** and **93** used in this study.

Trimethoprim (see Figure 2) is a dihydrofolate reductase inhibitor used primarily to treat bladder infections.¹⁰ It is active against several significant human pathogens including *Streptococcus pneumoniae* and *Haemophilus influenzae*. The choice to of alkyne tail attachment point (see Figure 6) is based on the use of that same point in a fluorogenic trimethoprim tag synthesised by Jing *et al.*¹¹

2.1.3 Autoinducer-antibiotic conjugates

A copper(I)-catalysed azide-alkyne cycloaddition,^{1,2} commonly referred to as a click reaction (although this is a more general term), was used to join each combination of autoinducer and antibiotic together (see Scheme 1).

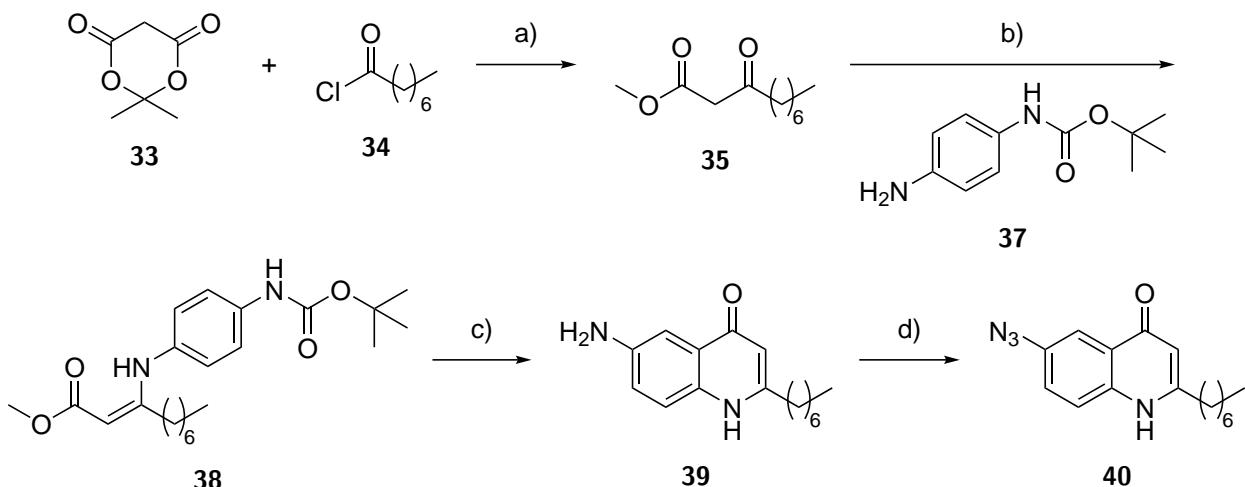

Scheme 1: The construction of the triazole-linked autoinducer-antibiotic conjugate library using a copper(I)-catalysed azide-alkyne cycloaddition.

2.2 Azido autoinducer derivatives

2.2.1 Synthesis of 6-N₃-HHQ **40**

The synthesis of 6-N₃-HHQ **40** is shown in Scheme 2 and follows a route devised by Baker.⁶ Octanoyl chloride **34** was converted to β -Ketoester **35** via a Meldrum's acid adduct.^{12,13} The β -ketoester **35** was condensed with *N*-Boc-*p*-phenylenediamine **37** to form enamine **38**. The disappointing yield of this step was in part due to the reaction proceeding to an equilibrium state rather than to completion, and hence not all of the starting material being consumed; starting materials can be recycled to improve the yield. Alternatively, Baker later found a higher-yielding reaction using a ZrCl₄ catalyst.

The enamine **38** was cyclised with polyphosphoric acid to form amino-HHQ **39** in good yield. The amine group of amino-HHQ **39** was converted to a diazo group by reaction with NaNO₂ and HCl, followed by displacement with NaN₃ to form the final azido-HHQ product **40**.¹⁴

Scheme 2: The synthesis of **40**. a) i) Pyridine, DCM, 0 °C. ii) MeOH, reflux, 66 % over two steps. b) MeOH, reflux, 19 %. c) Polyphosphoric acid, 120 °C, 72 %. d) i) NaNO₂, HCl, H₂O, 0 °C. ii) NaN₃, H₂O, r.t., 46.5 %.

2.2.2 Synthesis of 6-N₃-PQS **51**

The synthesis of 6-N₃-PQS **51** is shown in Scheme 3, and also follows a route devised by Baker.⁶ The Weinreb amide **45**¹⁵ was prepared from chloroacetyl chloride, followed by attack with heptyl magnesium bromide **42** to form 1-chlorononan-2-one **46** following a procedure described by Hodgkinson *et al.*¹⁶

The synthesis of PQS **4** described by Hodgkinson *et al.*¹⁶ used a microwave reaction of 1-chlorononan-2-one **46** with anthranilic acid. It was hoped that the azide group could be installed by using 5-nitroanthranilic acid **47** in the place of anthranilic acid in this microwave reaction, so that the nitro group could then be converted to an azide group via an amine. However, the microwave-catalysed reaction failed when 5-nitroanthranilic acid **47** was used.⁶ Therefore, a two step process was employed instead.

5-Nitroanthranilic acid **47** was heated with K₂CO₃ to deprotonate the carboxylic acid, followed by addition of 1-chlorononan-2-one **46** to form the ester **48** by S_N2 displacement of the chlorine atom in a procedure adapted from Hlaváč *et al.*¹⁷ Cyclisation with polyphosphoric acid produced nitro-PQS **49** cleanly.^{17,18}

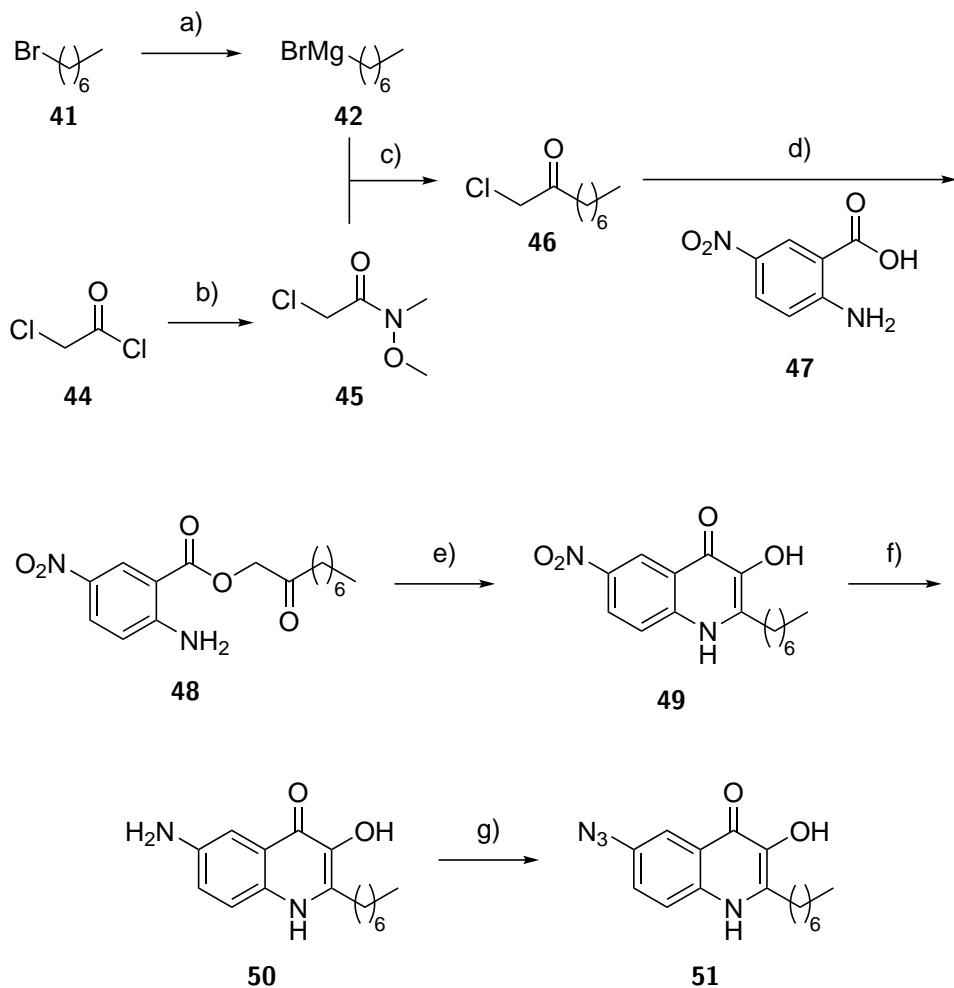

Conditions for the reduction of the nitro group were then compared (see Table 1). Baker initially used Zn and HCl, however this gave a yield over 100 % suggesting coordination of Zn to the amino-PQS **50**⁶ (this product was taken through and purified after the next step). She also attempted reduction with Pd/C and H₂ or ammonium formate, but no reaction was observed.

Further conditions were tested in *this* work in order to obtain a clean sample of amino-PQS **50**. An initial test of reduction with SnCl₂ produced no detectable product by LCMS. Catalytic hydrogenation using harsher conditions was then attempted, and it was determined that increasing the pressure to 3 atm using a Paar hydrogenator causes full conversion in 4 h using Pd/C and H₂. Good yields (80 %) were also achieved using PtO₂ as a catalyst, with the advantage that the reaction proceeds more quickly, and at atmospheric pressure and temperature.¹⁹

Finally, amino-PQS **50** was converted to azido-PQS **51** by reaction with NaNO₂ and HCl to form diazo-PQS, followed by displacement of the diazo group using NaN₃ to give the azido-PQS **51**.¹⁴ The yield of this reaction was rather disappointing (28 %), and is probably due to loss of product in the supernatant following precipitation.⁶

Conditions	Outcome
H ₂ , Pd/C, 1 atm, r.t., 18 h	No reaction
NH ₄ HCO ₂ , Pd/C, 1 atm, r.t., 18 h	No reaction
Zn, HCl (aq), r.t., 5 min h	Product 50 + Zn, assumed quantitative yield
SnCl ₂ .2H ₂ O, MeOH, r.t., 18 h	No reaction

Scheme 3: The synthesis of **51**. a) Mg turnings, THF, r.t., 2 h then reflux, 2 h. b) *N*,*O*-dimethylhydroxyl amine hydrochloride, K₂CO₃, toluene, H₂O, -5 °C to r.t., 30 min, 71 %. c) THF, 0 °C to r.t., 15 h, 96 %. d) **47**, K₂CO₃, DMF, 90 °C, 1 h, then **46**, r.t., 18 h, 100 %. e) Polyphosphoric acid, 90 °C, 5.5 h, 40 %. f) H₂, PtO₂, MeOH, 1 atm, r.t., 45 min, 80 %. g) i) NaNO₂, HCl, H₂O, 0 °C, 50 min. ii) NaN₃, H₂O, r.t., 4 h, 28 % over two steps.

2.2.3 Synthesis of the azido C₄-HSL derivatives **57**, **60** and **63**

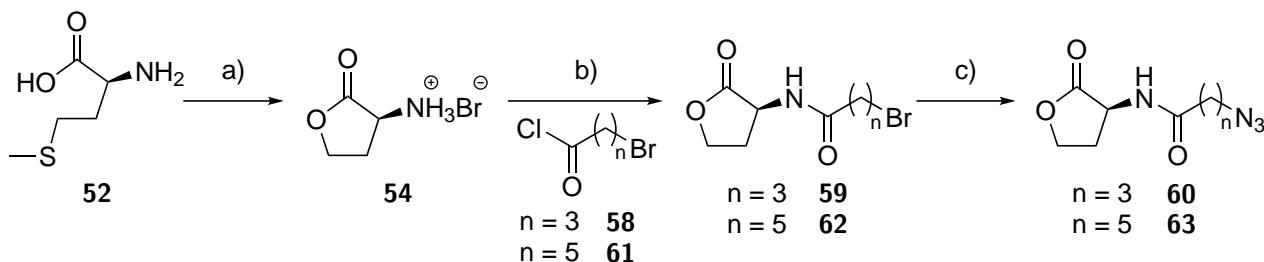

N₃-C₂-HSL **57** (the azido derivative of C₄-HSL with a C₂ chain, see Scheme 4) has previously been prepared by Stacy *et al.*²⁰ Their synthesis was followed, starting with the cyclisation of L-methionine **52** using bromoacetic acid to form the homoserine lactone HBr salt **54**. The disappointing yield can be attributed to difficulties in precipitating the final product. The homoserine lactone HBr salt **54** was then converted by a biphasic one-pot process to N₃-C₂-HSL **57** using bromoacetyl bromide **55** and NaN₃.

Scheme 4: The synthesis of **57**. a) Bromoacetic acid, *i*-PrOH:H₂O:AcOH (5:5:2), r.t., 18 h, 41 %. b) NaN₃, NaHCO₃, H₂O/CH₂Cl₂, r.t., 18 h, 41 %.

It was hoped that this procedure could also be used to produce the C₄ and C₆ derivatives, however, attempts to convert homoserine lactone **52** to N₃-C₄-HSL **60** using 4-bromobutyryl chloride **58** produced a complex mixture of products. This is likely to be because the S_N2 reaction in which the azide anion displaces bromine is slower for the C₄ derivative as the bromine atom being displaced is no longer adjacent to a carbonyl group. In addition, the longer chain length allows intramolecular cyclisation of the bromide with the secondary amide. The conversion was therefore carried out as a two-step process, where a bromoacyl chain was initially installed, followed by the S_N2 reaction with NaN₃ (see Scheme 5).

Reaction of the homoserine lactone HBr salt **54** with 4-bromobutyryl chloride **58** or 6-bromohexanoyl chloride **61** produced Br-C₄-HSL **59** or Br-C₆-HSL **62** respectively, in good yields. Heating with NaN₃ in DMF converted Br-C₆-HSL **62** to N₃-C₆-HSL **63**. Similar conditions were used by Dr. Bin Yu, a visiting PhD student in the Spring group, to convert the bromo-C₄ derivative **59** to the azido-C₄ derivative **60**, and this compound was kindly donated to complete the set. Yields for the S_N2 reaction could probably be improved by decreasing the temperature (see Scheme 14, for example).

Scheme 5: The synthesis of **60** and **63**. a) Bromoacetic acid, *i*-PrOH:H₂O:AcOH (5:5:2), r.t, 18 h, 41 %. b) NaHCO₃, H₂O/CH₂Cl₂, r.t., 18 h, **59**: 80 %, **62**: 66 %. c) NaN₃, DMF, 100 °C, 5 h, **63**: 27 % (donated by Dr. Bin Yu), **63**: 56 %.

2.3 Alkynyl antibiotic derivatives

2.3.1 Synthesis of the alkynyl ciprofloxacin derivative 70

The retrosynthesis of ciprofloxacin derivative **70** is shown in Scheme 6. The disconnection to an alkynyl piperazine **70** and a commercially available ciprofloxacin precursor **69** was chosen based on a study by Renau *et al.*, who found this route to be "...superior to previous reports which involved alkylation of piperazine with an appropriate alkyl halide."^{9,21}

It was envisaged that the alkynyl piperazine **70** could be prepared from mono-Boc-protected piperazine **66** and hex-5-ynal **65** using conditions similar to those used by Renau *et al.*⁹

Unlike the aldehydes and ketones used by Renau *et al.*,⁹ hex-5-ynal **65** is not commercially available and so it was hoped that this could be prepared by oxidation of hex-5-ynol **64**.

Scheme 6: The retrosynthesis of **70**.

The synthesis of ciprofloxacin derivative **70** is shown in Scheme 7. Hex-5-ynal **65** was prepared by PCC oxidation of hex-5-ynol **64** in good yield according to the procedure described by Kocsis *et al.*²²

Renau *et al.*⁹ used sodium cyanoborohydride to facilitate the reductive amination of hex-5-ynal **65** and 1-Boc-piperazine **66**. However, it was decided to attempt this transformation using the less toxic sodium triacetoxyborohydride following a procedure reported by Abdel-Magid *et al.*²³ This reaction yielded compound **67** in excellent yield, which was deprotected using TFA using the procedure described by Renau *et al.*⁹ to give the alkynyl piperazine **68** quantitatively.

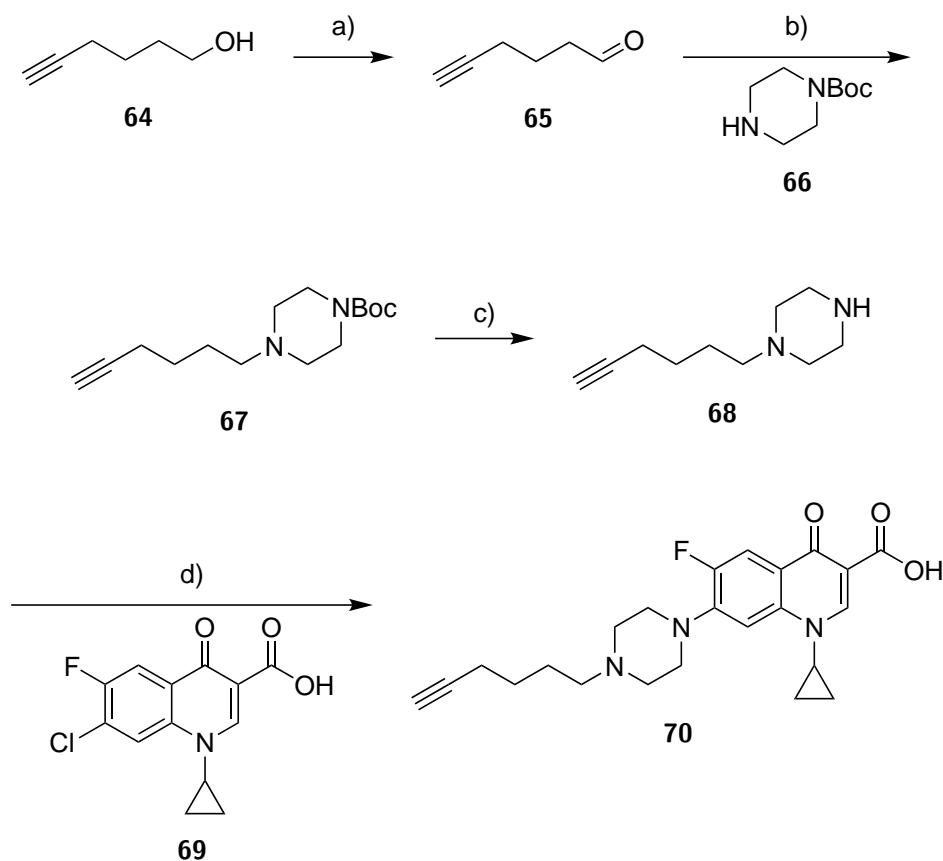

The alkynyl piperazine **68** was refluxed in MeCN with the ciprofloxacin precursor **69** according to the procedure described by Renau *et al.*,⁹ however the reaction did not proceed. Addition of 2 eq. of NEt₃ did not lead to reaction, however it was found that refluxing in neat NEt₃ led to conversion to the final ciprofloxacin derivative **70**.

With a small sample of the final product in hand, less harsh conditions were sought for a larger-scale version of the final reaction. Microwave irradiation at 115 °C was used, following a procedure by Reddy *et al.*²⁴ DMSO and NMP were tested as solvents, with or without the addition of TEA. The reactions were monitored using

LCMS, and NMP without TEA was found to give the highest conversion.

Work-up of this reaction proved difficult, with an unknown dark brown viscous liquid being formed which was difficult to separate from the white solid product. A pure sample was obtained by recrystallisation from EtOAc, but the yield was rather poor (11.8 %). The reaction was observed to stall after a certain point, while still having some of the ciprofloxacin precursor **69** present. The alkynyl piperazine **68** was not observed by TLC despite having been added in two-fold excess, suggesting that it degraded to a by-product before having chance to react.

Further attempts to refine this reaction might involve lower temperatures, higher ratios of the alkynyl piperazine **68** or improvement of the purification, e.g. by finding better precipitation conditions or by using reverse-phase chromatography. A Buchwald-Hartwig coupling or Ullmann reaction could also be attempted, but, as seen later, coordination of ciprofloxacin to Cu can hinder catalysis.

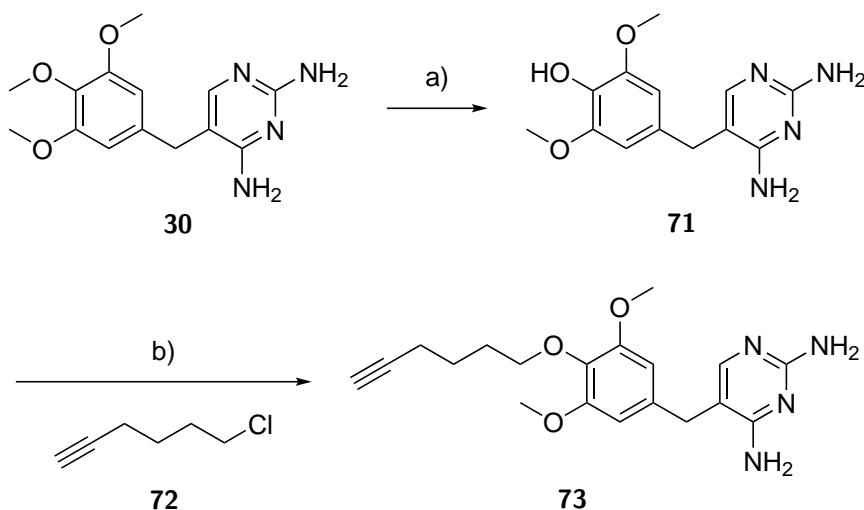

Scheme 7: The synthesis of **70**. a) Pyridinium chlorochromate, CH_2Cl_2 , r.t., 5 h, 72 %. b) $\text{NaBH}(\text{AcO})_3$, 1,2-dichloroethane, r.t., 10.5 h, 99 %. c) TFA, r.t., 1 h, 100 %. d) NMP, microwave, 115 °C 24 h, 11.8 %.

2.3.2 Synthesis of the alkynyl trimethoprim derivative **73**

The synthesis of trimethoprim derivative **73** is shown in Scheme 8. Trimethoprim was selectively deprotected using HBr (aq.) using a procedure described by Jing *et al.*¹¹ to form **71**. A slightly longer reaction time (40 min vs 20 min) probably led to the yield being slightly somewhat lower than that obtained by Jing *et al.* The main impurity was asymmetrically di-demethylated trimethoprim, which could be identified by the presence of two aryl peaks at 6.41 (d, $J=2.0$ Hz, 1 H) and 6.34 (d, $J=2.0$ Hz, 1 H) and a corresponding methyl peak at 3.82 (s, 3 H) in the crude NMR.

The alkynyl trimethoprim derivative **73** was synthesised from the demethylated trimethoprim **71** and 6-chloro-1-hexyne **72** using a Cs_2CO_3 -catalysed S_N2 reaction similar to that used by Jing *et al.*

2.4 Triazole-linked autoinducer-antibiotic conjugates

2.4.1 Optimisation of the click reaction

Test reactions using N₃-C₂-HSL **57** and the alkynyl ciprofloxacin derivative **70** were performed to find conditions for the click reactions between the azido autoinducers and the alkynyl antibiotics (see Table 2 and Scheme 9). Stirring at r.t. had no effect even with an extended reaction time. Heating to 50 °C did lead to slow formation of the product, but a mixture of the 1,4 **74** and 1,5 **75** isomers was observed in an approximately 4:1 ratio by LCMS (see Figure 8). Use of the ligand tris(3-hydroxypropyltriazolylmethyl)amine (THPTA) **76** (see Figure 7) led to some conversion at room temperature, however the reaction stopped before completion, probably due to oxidation of the Cu(I) catalytic species. When degassed solvent and an argon atmosphere were used the reaction proceeded to completion at room temperature in around 3 h.

Conditions	Outcome
CuSO ₄ ·H ₂ O, sodium ascorbate, H ₂ O, <i>t</i> -BuOH, air, r.t., 7 d.	No reaction
CuSO ₄ ·H ₂ O, sodium ascorbate, H ₂ O, <i>t</i> -BuOH, air, 50 °C, 5 d.	1,3-Triazole product 74 and 1,5 triazole impurity 75 4:1

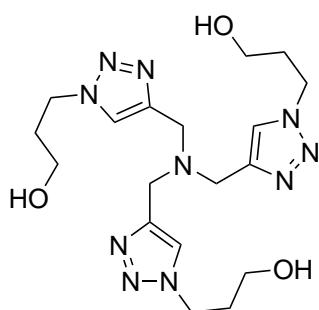

Figure 7: Tris[(1-benzyl-1*H*-1,2,3-triazol-4-yl)methyl]amine (THPTA) **76**.

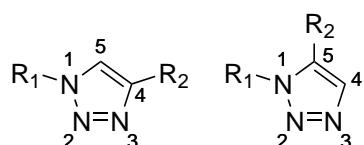

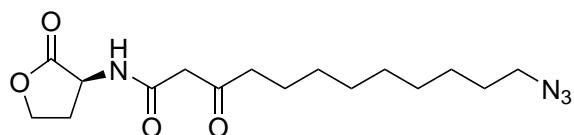

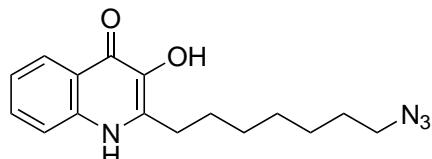

Figure 8: 1,4 (left) and 1,5 (right) triazoles.

2.4.2 Synthesis of the autoinducer-ciprofloxacin and autoinducer-trimethoprim triazole conjugates

Once conditions had been found for the click reaction, the synthesis of other conjugates was attempted. Two additional azides were kindly donated by members of the Spring group: the azido derivative of 3-oxo-C₁₂-HSL **77** was synthesised by Ryan Howard, a master's student under my supervision²⁵ and the tail azide derivative of PQS **78** was synthesised by Ysobel Baker⁶ (see Figure 9).

77

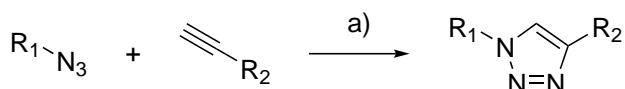

78

Figure 9: Further azido autoinducer derivatives synthesised by Howard²⁵ **77** and Baker⁶ **78**.

Synthesis of the conjugates proved more difficult than expected, for several reasons. Firstly some compounds did not dissolve in the reaction solvent (50 % water/*t*-BuOH) requiring addition of co-solvents such as CH₂Cl₂. Secondly, some compounds were unstable: HSL derivatives hydrolysed upon attempted preparative HPLC purification and the 3-oxo-C₁₂-HSL conjugates degraded during the reaction. Finally, the reaction was highly air-sensitive which led to stalling. The most reliable procedure was determined over the course of several reactions, and is shown in 4.25.

Nonetheless, several conjugates were produced for testing. The results of the reactions are shown in Table 3, Table 4, Table 5 and Table 6. It was intended that the failed reactions would be repeated, but as preliminary biological testing proved unpromising it was decided that attention should be focused elsewhere.

2.4.3 Synthesis of homoserine lactone-ciprofloxacin triazole conjugates with cleavable linkers

In addition to the conjugates shown in the previous section, a further collection was synthesised in collaboration with Prof. Eddy Sotelo, a visiting researcher in the Spring group. Prof. Sotelo synthesised two alkyne-linked ciprofloxacin derivatives **92** and **93** (see Figure 10), both with cleavable linkers (see ??).

link
this up

Figure 10: The cleavable alkyne-Cip derivatives synthesised by Prof. Sotelo.

Prof. Sotelo then performed click reactions using the AHL azide derivatives **57**, **60** and **63** shown in 2.2.3 to form a library of conjugates (see Figure 11). It was hoped that these conjugates would enter the cell and then be cleaved by esterases to release ciprofloxacin (see ??).

In addition, two control compounds **100** and **101** with benzyl head groups were produced by Prof. Sotelo (see Figure 12). It was hoped that these would show whether the AHL head group is required for activity.

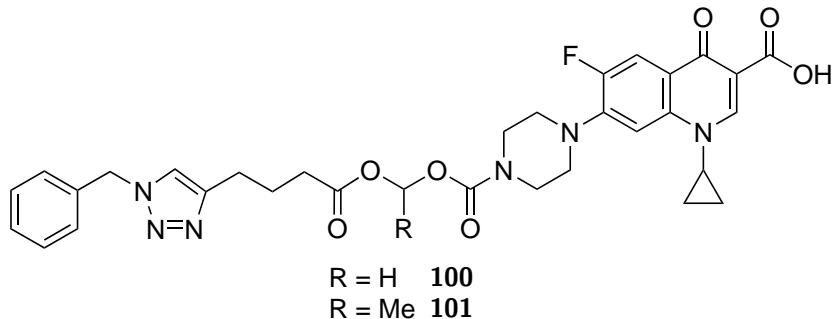

Figure 12: The cleavable Bn-Cip triazole conjugates **100** and **101** synthesised by Prof. Sotelo.

3 Autoinducer analogue-ciprofloxacin conjugates

3.1 Introduction

3.1.1 Inspiration

Following on from the library of compounds based on *P. aeruginosa* autoinducers, a series of conjugates based on *analogues* of C₄-HSL were planned. This strategy was inspired by a paper²⁶ and patent²⁷ by Ganguly *et al.*, who synthesised and characterised a conjugate **105** of methyl ciprofloxacin with homocysteine thiolactone (see Figure 13). Homocysteine thiolactone is an analogue of homoserine lactone with the ring oxygen replaced by sulfur, and has been used as the head group in several other known quorum sensing modulators.²⁸⁻³⁵

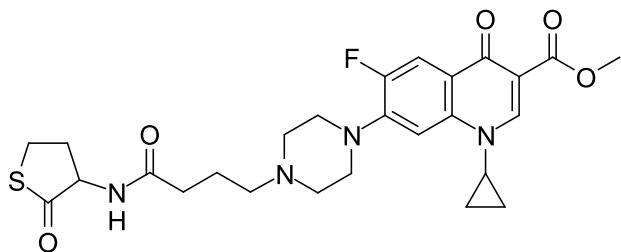

Figure 13: The HCTL-CipMe conjugate **105** studied by Ganguly *et al.*^{26,27}

As part of their characterisation of the HCTL-CipMe conjugate **105**, Ganguly *et al.* found the minimum inhibitory concentration (MIC) of the conjugate in *P. aeruginosa* under standard planktonic conditions. The MIC was found to be ten times higher for the conjugate vs. ciprofloxacin (50 vs. 5 μm), indicating that the conjugate was less effective than ciprofloxacin under planktonic conditions.

Ganguly *et al.* then investigated the effect of the conjugate on biofilms. The conjugate and ciprofloxacin were first added to dilute *P. aeruginosa* liquid culture at 25 μm . As expected, the culture failed to grow and form biofilm in the presence of ciprofloxacin, but did grow in the presence of the conjugate **105**. They then incubated cultures for 24 h, to allow biofilms to grow, before adding the compounds. In contrast, they found that the conjugate **105** disrupted the biofilm more effectively than ciprofloxacin. When the biofilm was grown for 48 or 72 hours the conjugate had similarly disruptive effects, whereas ciprofloxacin ‘did not show any significant antibacterial activity’.

These results are exciting as they hint that an autoinducer conjugate might be able to combat an established *P. aeruginosa* infection more effectively than the unmodified antibiotic. Ganguly *et al.* suggest that their conjugate is more effective than ciprofloxacin in penetrating biofilms, and/or better at avoiding being pumped out by multidrug efflux pumps. They posit that this could be due to the thiolactone head, as they also showed that unconjugated C₄-HCTL **158** (see Figure 14) has ‘either enhanced uptake or functional activity’ when compared with C₄-HSL **2**.

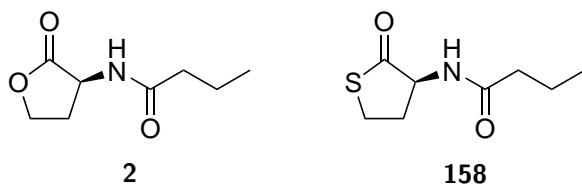

Figure 14: C₄-HSL **2** and C₄-HCTL **158**. Note that Ganguly *et al.* tested the *S* enantiomer of C₄-HCTL **158**, but used a racemic mixture in their HCTL-CipMe conjugate.

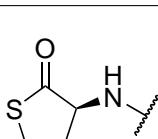

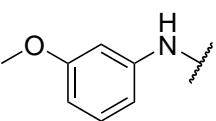

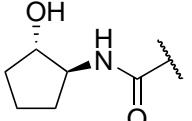

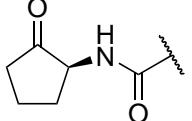

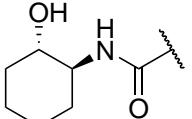

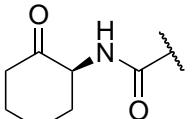

While the results found by Ganguly *et al.* show promise, they only test one conjugate, and do not include controls to show that the HCTL group specifically is necessary for the enhanced effect. It was therefore decided to build on this work by synthesising a series of ciprofloxacin conjugates with head groups known as part of quorum sensing modulators.^{7,36}

3.1.2 Head groups

The activity of the chosen head groups against *P. aeruginosa* receptors when coupled with the native C₄ and 3-oxo-C₁₂ tails is summarised in Table 7. It is speculated that high activity of these molecules should correlate with high activity of their ciprofloxacin conjugates. This is not a comprehensive list of active head groups, and other possible choices are covered in ??.

The exact head groups used in this study are shown in Figure 15. The cyclohexanol derivatives were synthesised as a diastereomerically pure racemate, whereas the cyclopentanol derivative¹ were synthesised as separate enantiomers. Unfortunately, cyclopentanone derivatives were not synthesised, and would be an obvious future addition to the library. The 2-methoxybenzene derivatives do not have precedents as quorum sensing modulators in the literature, but they were included so as to be compared with the 3-methoxybenzene derivatives.

Table 7: Activities of autoinducers containing the chosen head groups when coupled with C₄ or 3-oxo-C₁₂ tails.

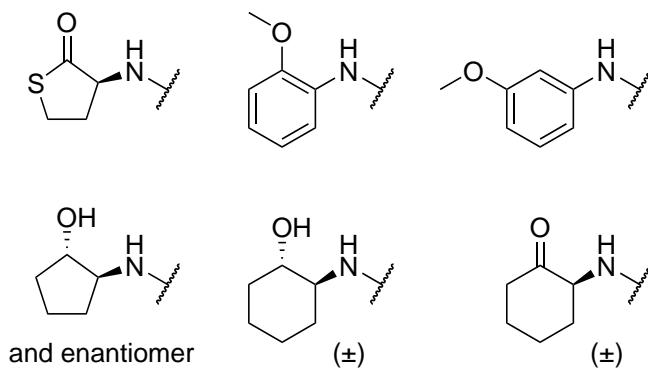

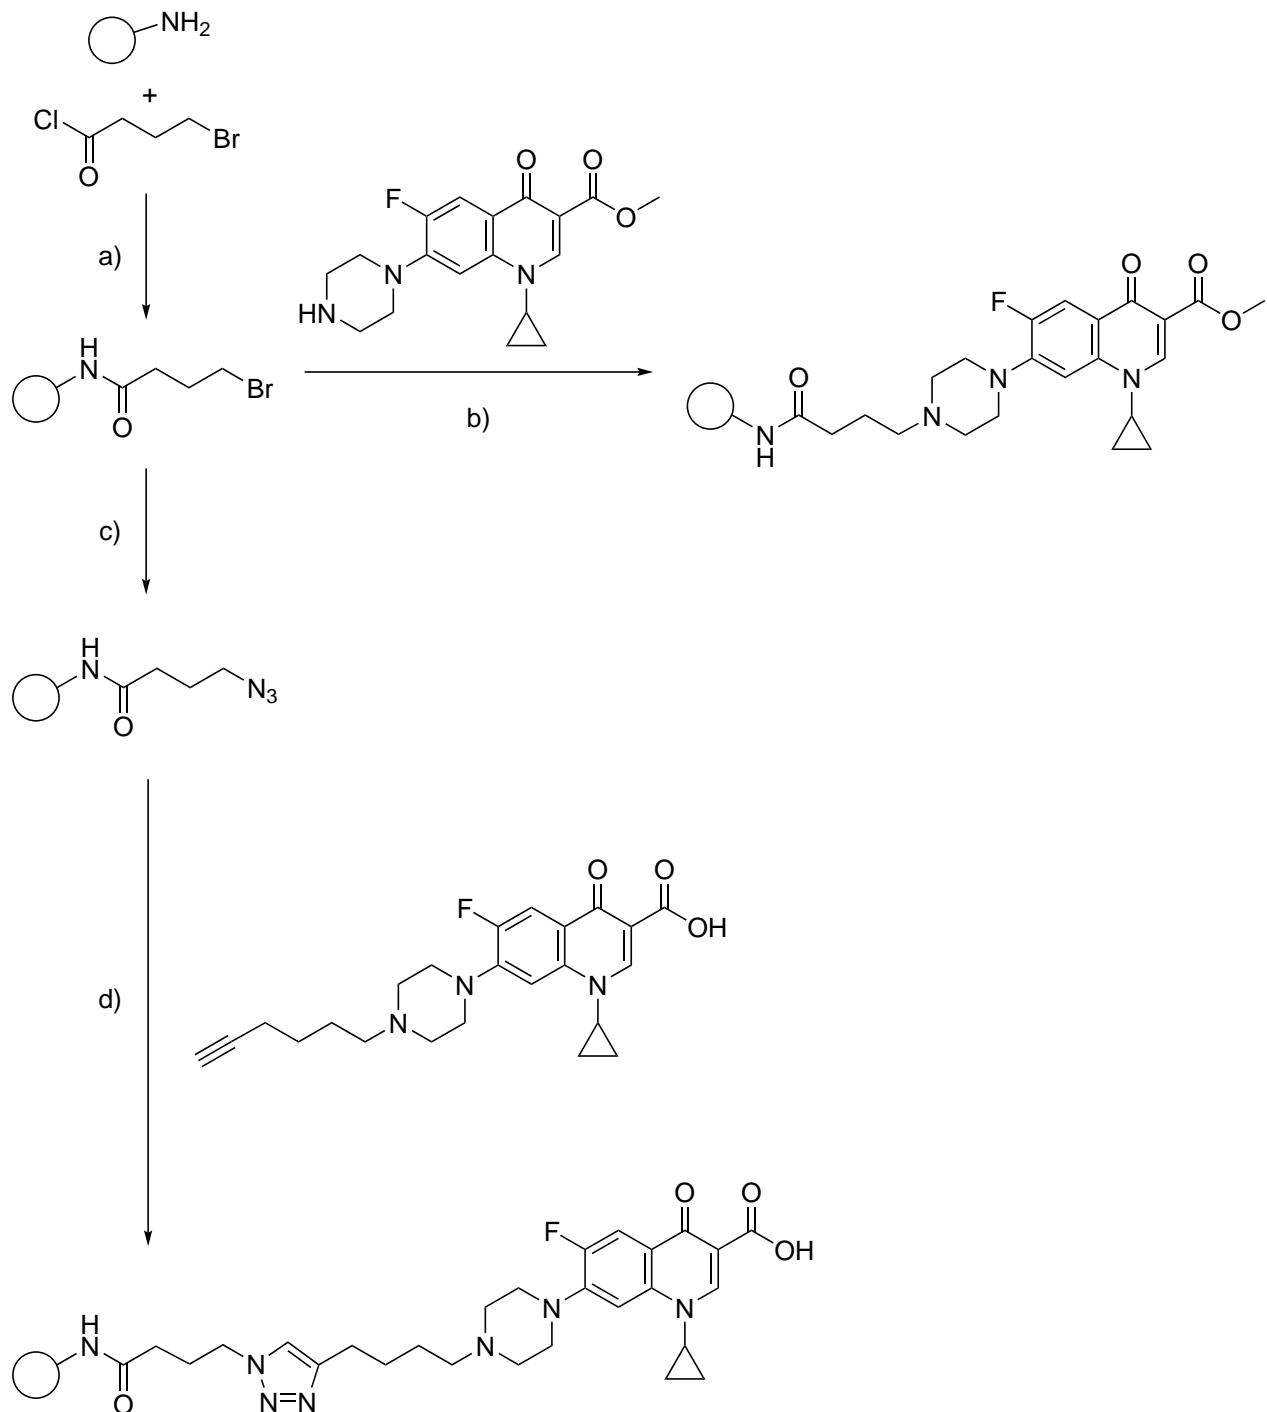

Figure 15: The head groups used in this section.

3.1.3 Linkers

As Ganguly *et al.*⁷ synthesised their conjugate from Br-C₄-HCTL, it was envisaged that a branching strategy could be used to produce two sets of conjugates (see Scheme 11). The first set would be formed by the S_N2 reaction of the relevant bromide with methyl ciprofloxacin. The second set would be made by displacing the bromide with azide, then performing a click reaction with the alkynyl ciprofloxacin derivative **70** made previously to form the triazole-linked product. Ketone conjugates would be formed by oxidation of the alcohols.

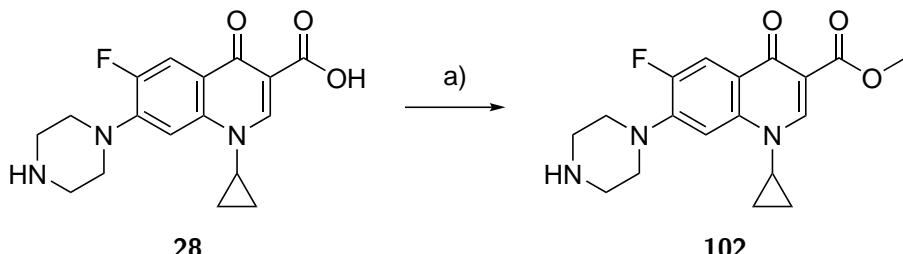

Scheme 11

3.2 Homocysteine thiolactone derivatives

3.2.1 Synthesis of methyl ciprofloxacin 102

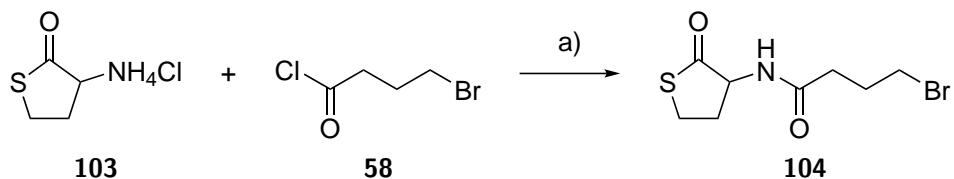

The synthesis of the analogue conjugates began with the synthesis of methyl ciprofloxacin **102**, which would then be attached to the various head groups. Methyl ciprofloxacin **102** was synthesised from ciprofloxacin **28** and MeOH in very good yield using *para*-toluenesulfonic acid as a catalyst.⁴⁰

Scheme 12: Synthesis of methyl ciprofloxacin **102**. a) *p*-TSA, MeOH, 72 h, reflux, 83.3 %.

3.2.2 Synthesis of Br-C₄-HCTL **104**

The HCTL head group was then attached to the linker to form Br-C₄-HCTL **104**, in preparation for coupling to methyl ciprofloxacin **102**. Br-C₄-HCTL **104** was synthesised using the Schotten-Baumann conditions employed previously for the HSL derivatives **59** and **62**. Br-C₄-HCTL **104** was isolated in markedly higher yield than that achieved by Ganguly *et al.*²⁶ (87.9 % vs. 25.0 %). It is possible that this was due to CH₂Cl₂ being used for the extraction, whereas Ganguly *et al.* used EtOAc.

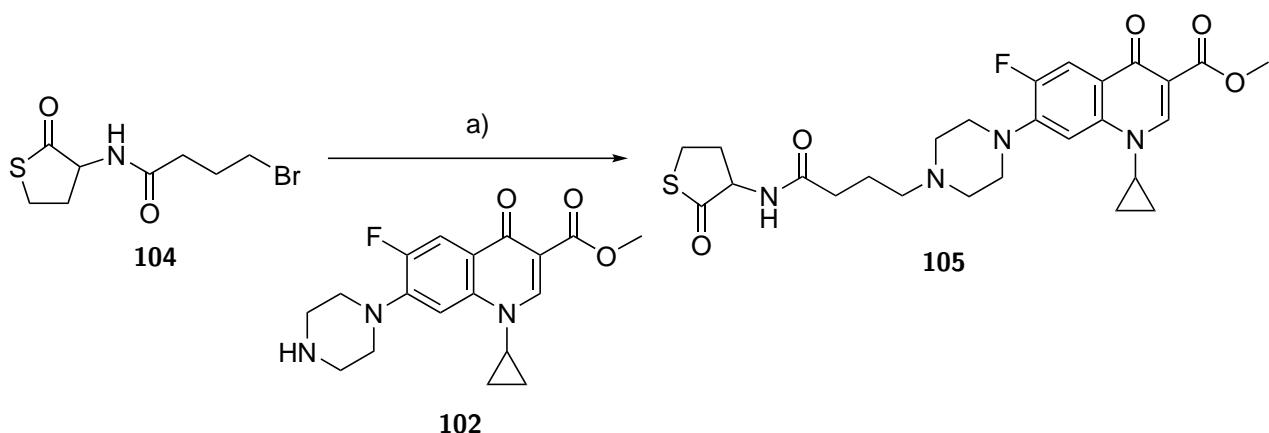

Scheme 13: Synthesis of Br-C₄-HCTL **104**. a) NaHCO_3 , CH_2Cl_2 , H_2O , 0°C , 1 h, 87.9 %.

3.2.3 Synthesis of the HCTL-CipMe conjugate **105**

The HCTL-CipMe conjugate **105** was synthesised using the procedure outlined by Ganguly *et al.*²⁶ Monitoring by LCMS showed slow conversion to the product. Br-C₄-HCTL **104** was presumably consumed by side reactions as 4 eq. were required to reach full conversion. Ganguly *et al.* do not quote a yield for comparison^{26,27} but it is hoped that the 12.2 % achieved here could be improved upon. The side reactions led to the production of an unidentified brown, viscous contaminant which made purification by flash column chromatography (as was used by Ganguly *et al.*) challenging. Preparatory HPLC on a partially purified sample gave enough pure HCTL-CipMe conjugate **105** for biological testing.

Future optimisation of the synthesis could focus on different routes to the product, e.g. the peptide coupling described in 3.5.4, or different purification methods, e.g. using just preparatory HPLC, or reverse phase flash column chromatography.

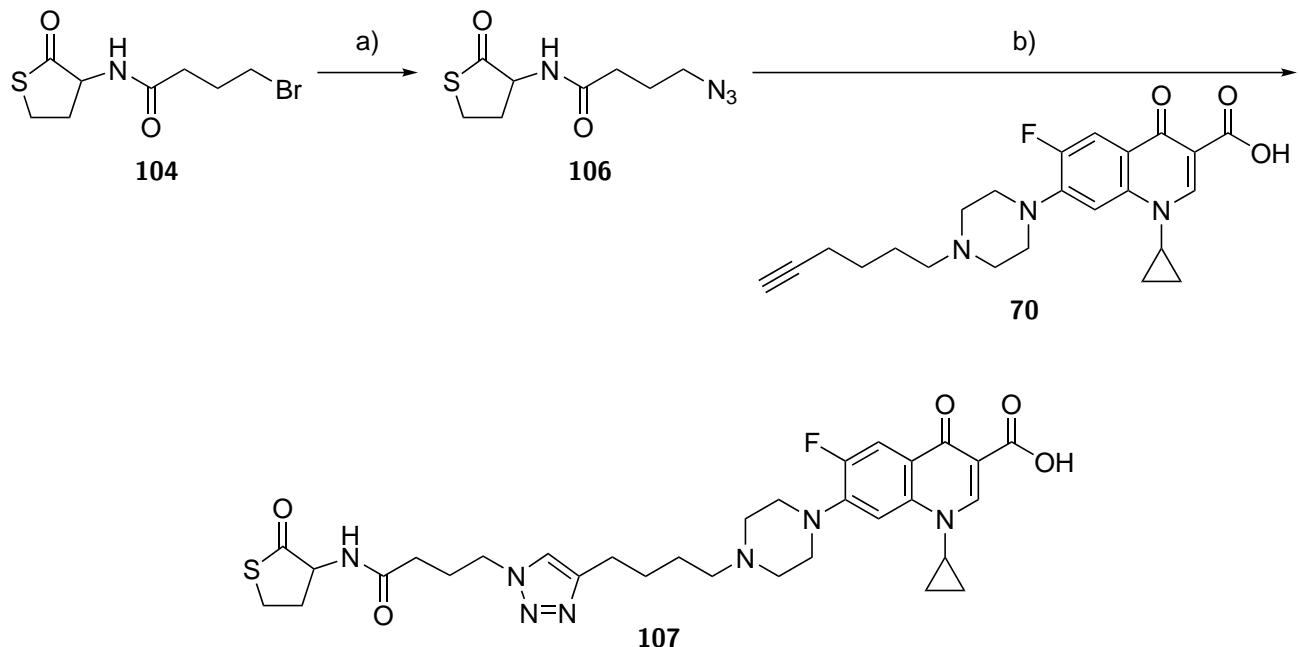

Scheme 14: Synthesis of the HCTL-CipMe conjugate **105**, N₃-C₄-HCTL **106**, and the HCTL-Cip triazole conjugate **107**. a) K_2CO_3 , acetonitrile, reflux, 24 h, 12.2 %.

3.2.4 Synthesis of the HCTL-Cip triazole conjugate **107**

Br-C₄-HCTL **104** was converted into N₃-C₄-HCTL **106** (see Scheme 14), by an S_N2 reaction with sodium azide which proceeded in excellent yield.

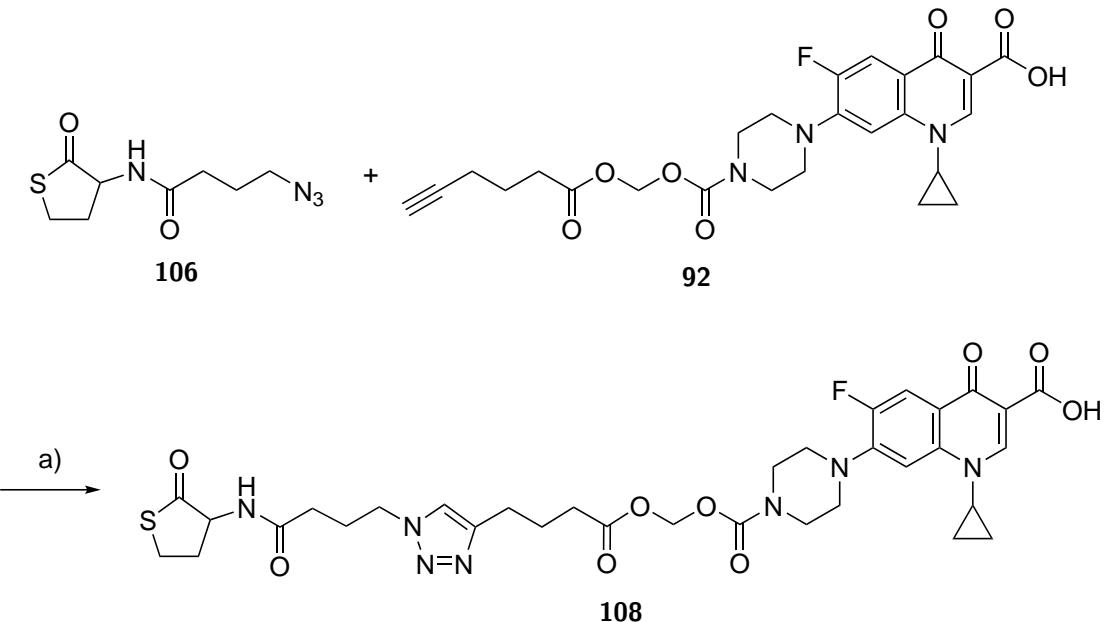

N₃-C₄-HCTL **106** was then subjected to the click reaction conditions optimised previously (see 4.25). The reaction proceeded very slowly at first, until it was realised that the azide did not dissolve in the reaction solvent and formed a single solid clump. DMSO was added as a co-solvent, and the reaction began to proceed, albeit still slowly. It is possible that the sulfur atom coordinates to the copper, thus inhibiting its catalytic ability. Nonetheless the HCTL-Cip triazole conjugate **107** was eventually isolated in good yield (see Scheme 15).

Scheme 15: Synthesis of the HCTL-Cip triazole conjugate **107**. a) NaN_3 , acetonitrile, reflux, 1.5 h, 89.3 %. b) CuSO_4 , THPTA, sodium ascorbate, H_2O , t-BuOH, DMSO, r.t., 7 d, 70.6 %.

3.2.5 Synthesis of the cleavable HCTL-Cip triazole conjugate 108

A cleavable conjugate **108** was also synthesised from N₃-C₄-HCTL **106** by reaction with a cleavable alkyne-Cip derivative **92** synthesised previously by Prof. Eddy Sotelo-Perez (see 2.4.3). Conditions developed by Prof. Sotelo-Perez were used, but again the reaction proceeded very slowly. The disappointing yield is, however, most likely due to losses during purification.

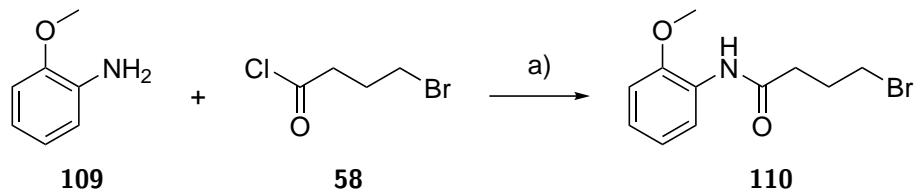

Scheme 16: Synthesis of the cleavable HCTL-Cip triazole conjugate **108**. a) CuI, DIPEA, CH₂Cl₂, r.t., 3 h, 5.0 %.

3.3 2-Methoxybenzene derivatives

3.3.1 Synthesis of Br-C₄-2-methoxybenzene 110

Br-C₄-2-methoxybenzene **110** was synthesised from 2-methoxyaniline **109** and 4-bromobutyryl chloride **58** using Schotten-Baumann conditions in 50.0 % yield (see Scheme 17). The compound is air and/or light sensitive, turning from an initially colourless liquid to blue then black if left out on the bench. It is likely that the mediocre yield is due to degradation during columning, and it is suggested that in future the compound should be used in its crude form to minimise exposure to air and light, as it was fairly pure by ¹H NMR before columning.

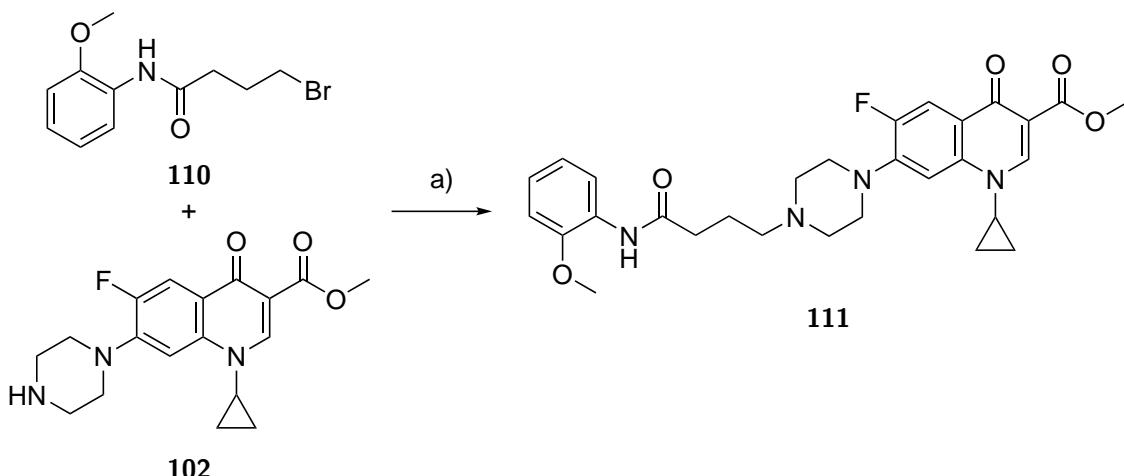

Scheme 17: Synthesis of Br-C₄-2-methoxybenzene **110**. a) NaHCO₃, CH₂Cl₂, H₂O, 0 °C, 1 h, 50.0 %.

3.3.2 Synthesis of the 2-methoxybenzene-CipMe conjugate 111

The procedure outlined by Ganguly *et al.*²⁶ was initially attempted in order to synthesise the 2-methoxybenzene-CipMe conjugate **111**, but the reaction was very slow and did not go to completion, presumably due to degra-

dation of Br-C₄-2-methoxybenzene **110**. New conditions, employing a microwave reactor and 2 eq. of Br-C₄-2-methoxybenzene **110** were then attempted, with a much greater conversion observed by LCMS after 4 h (see). However, a poor yield was obtained, potentially due to degradation during column chromatography, which took longer than for Br-C₄-2-methoxybenzene **110** because the 2-methoxybenzene-CipMe conjugate **111** is more polar.

Scheme 18: Synthesis of the 2-methoxybenzene-CipMe conjugate **111** and N₃-C₄-2-methoxybenzene **112**. a) NaI, DIPEA, acetonitrile, microwave reactor, 100 °C, 4 h, 10.2 %.

3.3.3 Synthesis of the 2-methoxybenzene-Cip triazole conjugate **113**

N₃-C₄-2-methoxybenzene **112** was synthesised from Br-C₄-2-methoxybenzene **110** by an S_N2 reaction with sodium azide (see). The yield of N₃-C₄-2-methoxybenzene **112** (26.7 %) was a lot lower than for N₃-C₄-HCTL **106** (89.3 %). The colour of N₃-C₄-2-methoxybenzene **112**, like its precursor, changed from clear to blue then black, suggesting that it is also air/light sensitive and may have degraded during columning. However, in this case it may not be better to use this product crude as several impurities could be observed by LCMS (see Figure 16).

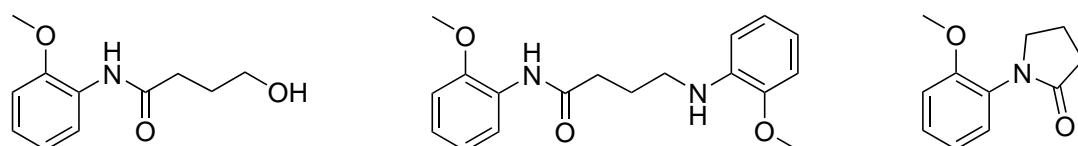

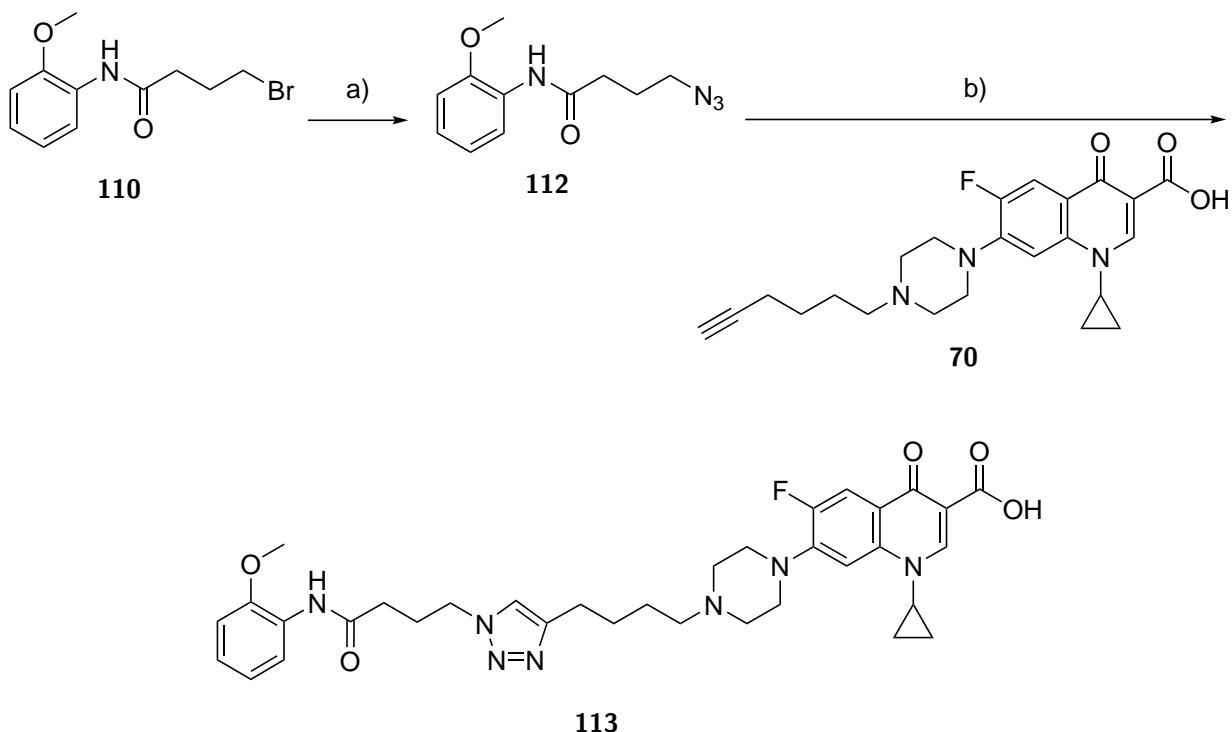

Figure 16: Impurities formed during the synthesis of N₃-C₄-2-methoxybenzene **112**.

The 2-methoxybenzene-Cip triazole conjugate **113** was synthesised using the standard click conditions (see 4.25), with the addition of CH₂Cl₂ as a co-solvent to aid the dissolution of N₃-C₄-2-methoxybenzene **112** (see Scheme 19). Again, the yield was somewhat low, probably due to air/light sensitivity of the starting material and/or product.

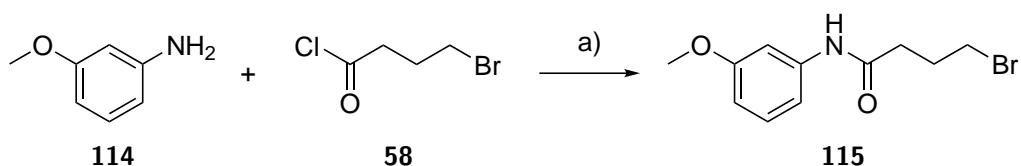

Scheme 19: Synthesis of the 2-methoxybenzene-Cip triazole conjugate **113**. a) NaN₃, acetonitrile, reflux, 2 h, 26.7 %. b) CuSO₄, THPTA, sodium ascorbate, H₂O, *t*-BuOH, CH₂Cl₂, r.t., 16 h, 39.0 %.

3.4 3-Methoxybenzene derivatives

3.4.1 Synthesis of Br-C₄-3-methoxybenzene **115**

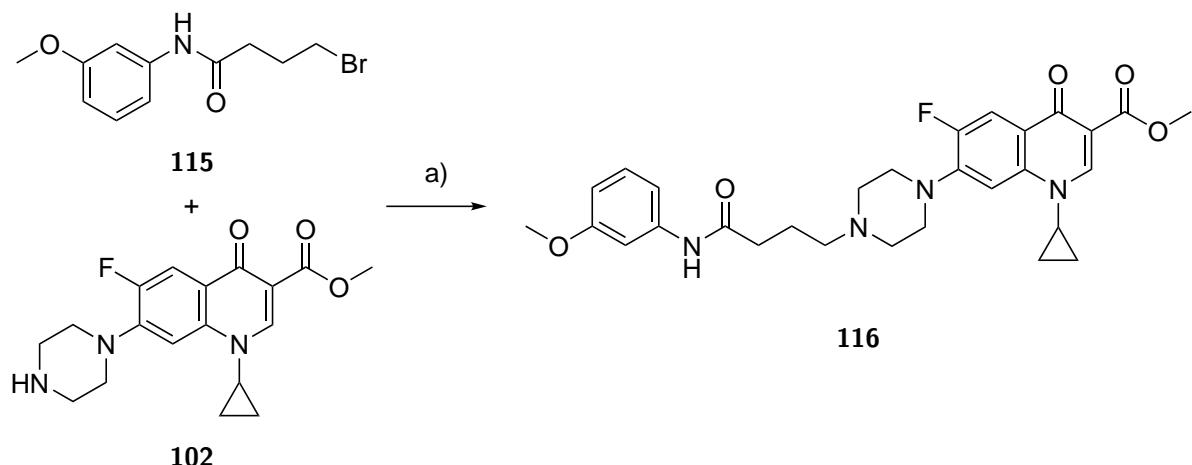

Br-C₄-3-methoxybenzene **115** was synthesised from 3-methoxyaniline **114** and 4-bromobutyryl chloride **58** using Schotten-Baumann conditions as above in almost identical (49.6 %) yield (see Scheme 20). The compound is probably also air and/or light sensitive, turning from a pale pink amorphous solid to a pale brown liquid.

Scheme 20: Synthesis of Br-C₄-3-methoxybenzene **110**. a) NaHCO₃, CH₂Cl₂, H₂O, 0 °C, 1 h, 49.6 %.

3.4.2 Synthesis of the 3-methoxybenzene-CipMe conjugate **116**

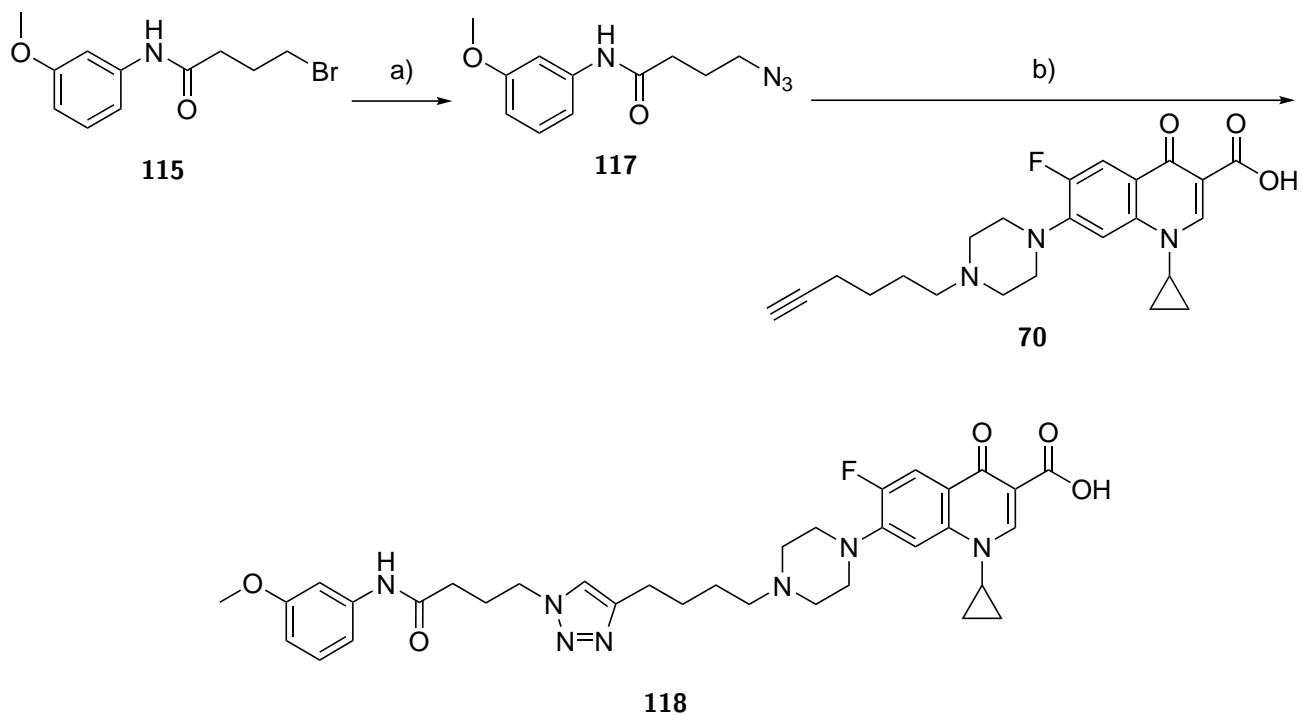

The 3-methoxybenzene-CipMe conjugate **116**, was synthesised as above, in similar yield (see Scheme 21).

Scheme 21: Synthesis of the 3-methoxybenzene-CipMe conjugate **116** and N₃-C₄-3-methoxybenzene **117**. a) NaI, DIPEA, acetonitrile, microwave reactor, 100 °C, 4 h, 10.5 %.

3.4.3 Synthesis of the 3-methoxybenzene-Cip triazole conjugate **118**

N₃-C₄-2-methoxybenzene **112** and the 3-methoxybenzene-Cip triazole conjugate **118** were synthesised as above, in similar yields (see Scheme 21 and Scheme 22).

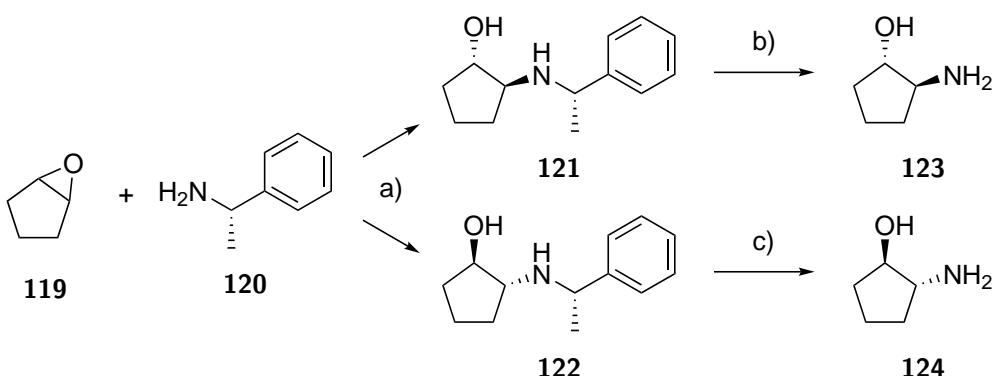

Scheme 22: Synthesis of the 3-methoxybenzene-Cip triazole conjugate **118**. a) NaN₃, acetonitrile, reflux, 7 h, 16.7 %. b) CuSO₄, THPTA, sodium ascorbate, H₂O, t-BuOH, CH₂Cl₂, r.t., 2 h, 5.0 %.

3.5 Cyclopentanol derivatives

3.5.1 Synthesis of the 2-aminocyclopentan-1-ol head groups **123** and **124**

Synthesis of the cyclopentanol derivatives began with the synthesis of (*1S,2S*)-2-aminocyclopentan-1-ol **123** and (*1R,2R*)-2-aminocyclopentan-1-ol **124** (see Scheme 23), using a procedure reported by Overman and Sugai.^{41–43} These precursors were synthesised by opening cyclopentene oxide **119** using (*S*)-1-phenylethan-1-amine **120** to give approximately equal amounts of two diastereomers, **121** and **122**, which were separated using column chromatography. The removal of the methylbenzyl groups proved more difficult than expected, with the conditions reported by Overman and Sugai⁴² yielding only a salt of the starting material. After several attempts under various conditions (including using the free amine vs. the salt, varying the temperature, ensuring the dryness of the reagents and adding acetic acid), an approach using H₂ gas was attempted (see Table 8). This proceeded smoothly at 5 atm to give the two enantiomers of 2-aminocyclopentan-1-ol, **123** and **124**, both in quantitative yield.

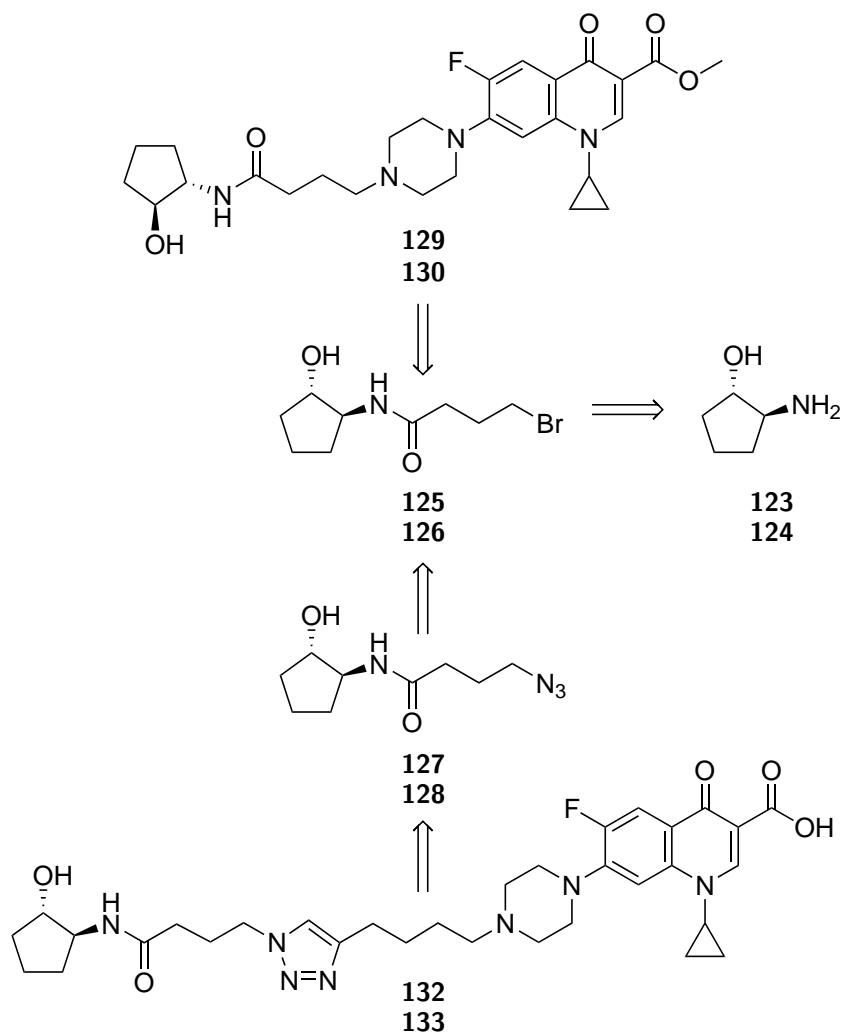

Scheme 23: Synthesis of (*1S,2S*)-2-aminocyclopentan-1-ol **123** and (*1R,2R*)-2-aminocyclopentan-1-ol **124**. a) AlMe₃, CH₂Cl₂, 0 °C, **121** (*SSS*): 35.2 %, **122** (*RRS*): 32.1 %. b) See Table 8. c) Pd(OH)₂, MeOH, H₂, 5 atm, r.t., 1 d, 100 %.

Conditions	Temperature and pressure	Time	Result
121 · HCl, ammonium formate, 10 % Pd/C, DMF	r.t., 1 atm	2 d	121 salt
121 , ammonium formate, 10 % Pd/C, DMF	r.t., 1 atm	2 d	121 salt
121 · HCl, ammonium formate, 10 % Pd/C, dry DMF	r.t., 1 atm	2 d	121 salt
122 , ammonium formate, 10 % Pd/C, dry DMF	r.t., 1 atm	2 d	122 salt
121 , ammonium formate, 10 % Pd/C, dry DMF	70 °C, 1 atm	1 d	121 salt

121 · HCl, Pd(OH) ₂ , MeOH, H ₂	r.t., 3.4 atm	1 d	123 salt, 121 salt, and an unidentified compound (approx. 7:2:10 by ¹ H NMR)
121 , Pd(OH) ₂ , MeOH, H ₂	r.t., 5 atm	1 d	123 , 100 % yield

Table 8: Conditions attempted for the synthesis of (*1S,2S*)-2-aminocyclopentan-1-ol **123** and (*1R,2R*)-2-aminocyclopentan-1-ol **124** (see Scheme 23).

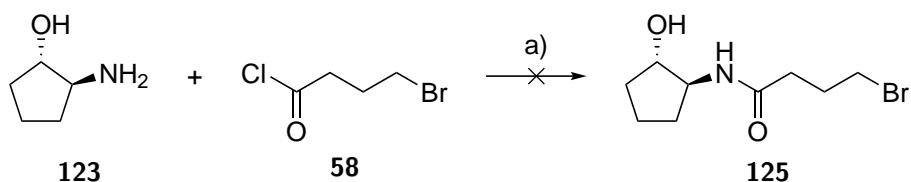

3.5.2 Initial branching route

An initial retrosynthesis of the conjugates is shown in Scheme 24, and follows a similar path to previous conjugates.

Scheme 24: Retrosynthesis of the cyclopentanol-CipMe conjugates **129** (*SS*) and **130** (*RR*), and the cyclopentanol-Cip triazole conjugates **132** (*SS*) and **133** (*RR*). *SS* enantiomers are shown, but both will be synthesised.

Synthesis of Br-C₄-cyclopentanol-(*SS*) **125** from (1*S*,2*S*)-2-aminocyclopentan-1-ol **123** and 4-bromobutyryl chloride **58** was attempted using Schotten-Baumann conditions (see Scheme 25). However, a large number of impurities were observed by LCMS (see Figure 17), and so three new strategies were attempted: protection of the alcohol (see 3.5.3), installing the linker on methyl ciprofloxacin **102** and then attaching the head group by peptide coupling (see 3.5.4), and using 4-chlorobutyryl chloride **147** as the linker instead of 4-bromobutyryl chloride **58** (see 3.6.3).

Scheme 25: Attempted synthesis of Br-C₄-cyclopentanol-(*SS*) **125**. a) NaHCO_3 , CH_2Cl_2 , H_2O , 0°C , 2 h.

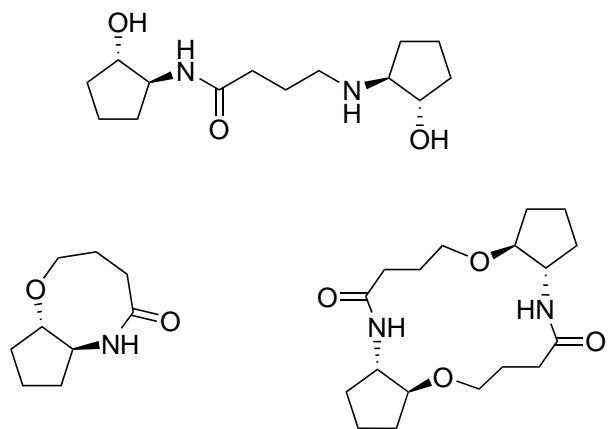

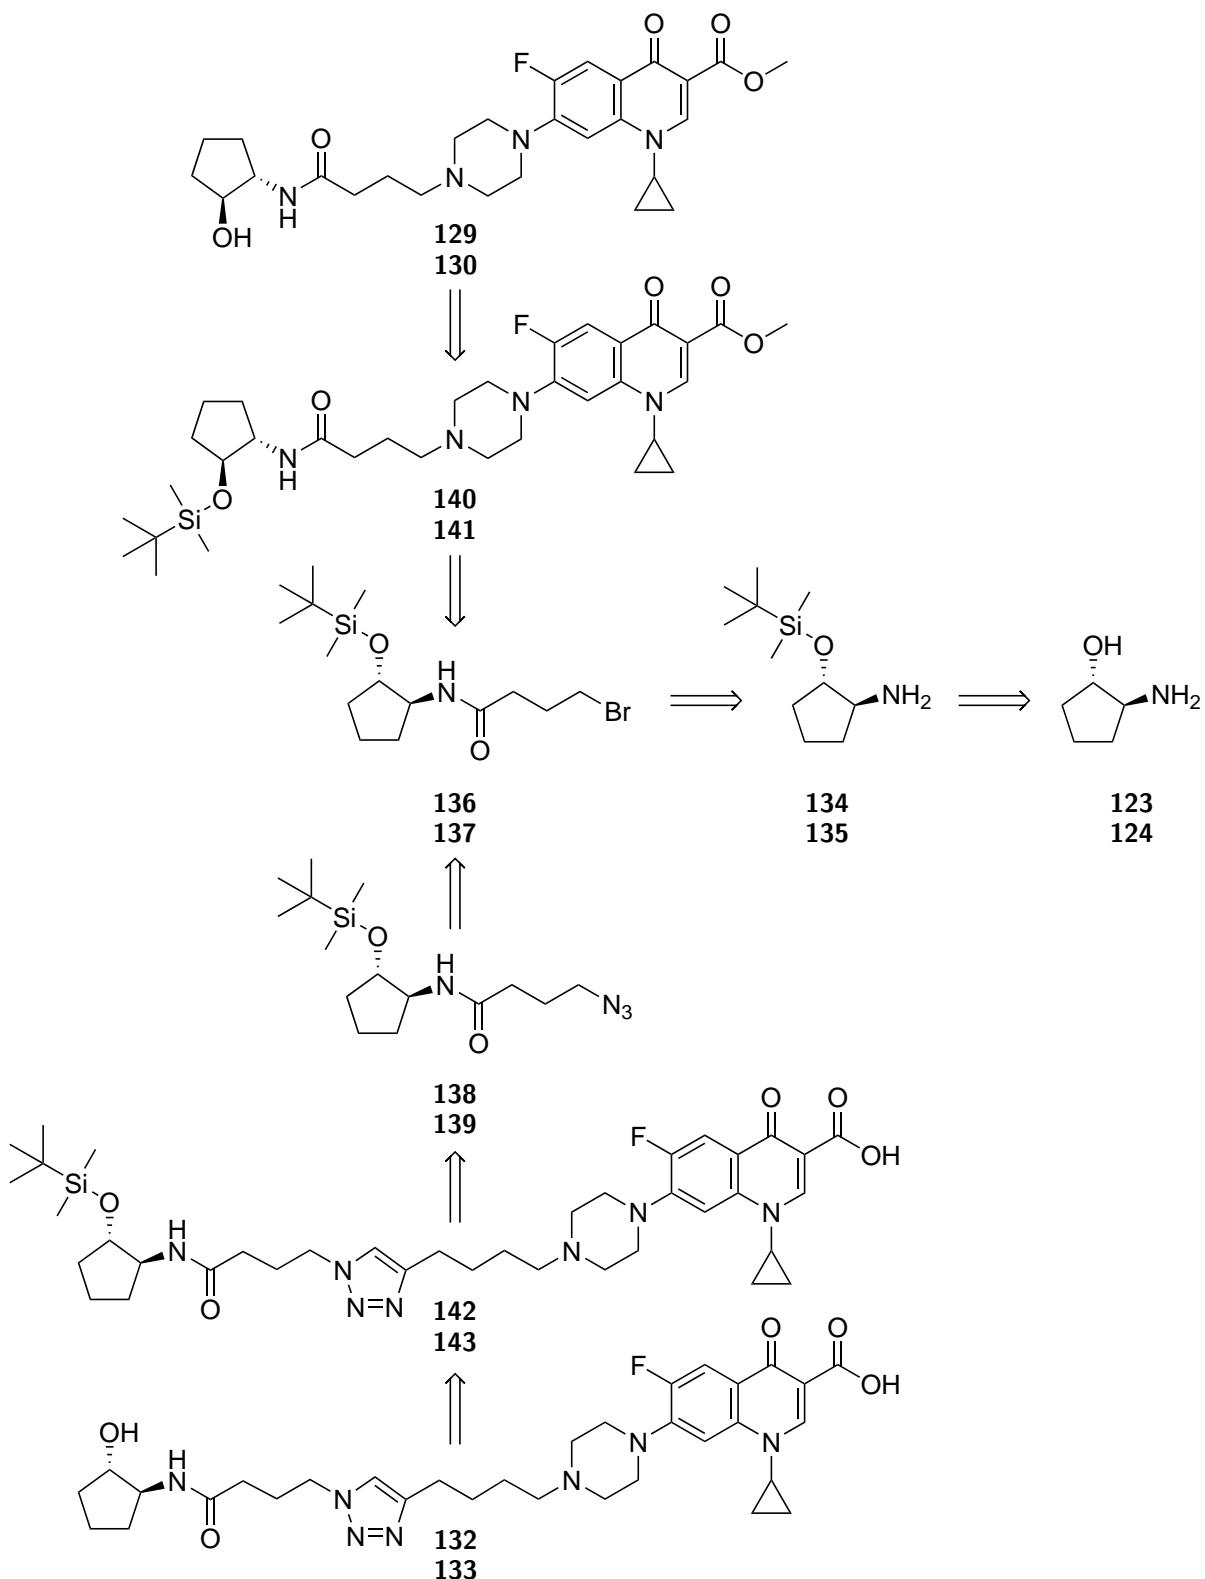

Figure 17: Impurities observed by LCMS during the synthesis of Br-C₄-cyclopentanol-(SS) **125**. Regiochemistry is speculative.

3.5.3 TBDMS protection route

The first attempt at an alternative strategy for the synthesis of the conjugates involved TBDMS protection of the alcohol (see Scheme 26). It was envisaged that protection would eliminate enough of the side reactions with products shown in Figure 17 that intermediates Br-C₄-cyclopentanol-(SS) **125** and N₃-C₄-cyclopentanol-(SS) **127** could be purified. The TBDMS group could be removed later in the synthesis using TBAF or acid.

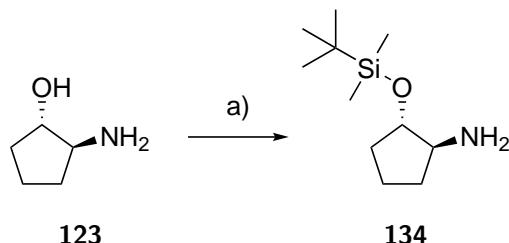

Scheme 26: Retrosynthesis of the cyclopentanol-CipMe conjugates **129** (*SS*) and **130** (*RR*), and the cyclopentanol-Cip triazole conjugates **132** (*SS*) and **133** (*RR*) using a TBDMS protection strategy. *SS* enantiomers are shown, but both will be synthesised.

3.5.3.1 Synthesis of TBDMS-protected (*1S,2S*)-2-aminocyclopentan-1-ol **123**

The synthesis began with the optimisation of the protection of (*1S,2S*)-2-aminocyclopentan-1-ol **123** with a TBDMS group on the alcohol (see Scheme 28). This reaction proved more problematic than expected, possibly

due to the amine group interfering with the reaction at the alcohol and/or the high polarity of the starting material causing problems with solubility in the reaction mixture and extraction during the work-up. Conditions attempted are summarised in Table 9. Protection attempts using TBDMSCl were generally unsuccessful, but eventually a method employed by Wu et. al⁴⁴ using TBDMSOTf was found to produce the desired product in excellent yield. Water was used for the work-up rather than NH₄Cl (sat. aq.), as the acidic work-up protonated the product. The TEA was removed during column chromatography instead.

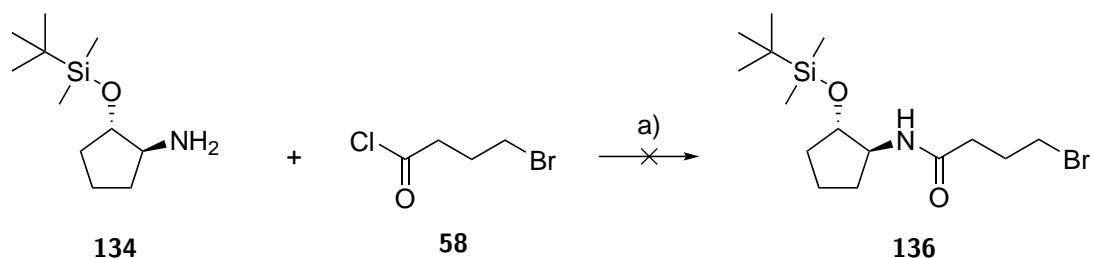

Scheme 27: Synthesis of TBDMS protected (1*S*,2*S*)-2-aminocyclopentan-1-ol **134**. a) See Table 9.

Conditions	Temperature	Time	Result
TBDMSCl, DMAP, TEA, CH ₂ Cl ₂ ⁴⁵	r.t.	18 h	Trace of 134 , mostly 123
TBDMSCl, imidazole, CH ₂ Cl ₂ ⁴⁶	0 °C	1 h	123
TBDMSCl, DBU, MeCN ⁴⁷	0 °C	1 d	123
TBDMSOTf, TEA, CH ₂ Cl ₂ , ⁴⁴ aq. workup then column	0 °C	6 h	134 , 97.7 % yield

Table 9: Conditions attempted for the synthesis of (1*S*,2*S*)-2-((*tert*-butyldimethylsilyl)oxy)cyclopentan-1-amine **134** (see Scheme 28).

3.5.3.2 Synthesis of Br-C₄-cyclopentanol-TBDMS-(SS) **136**

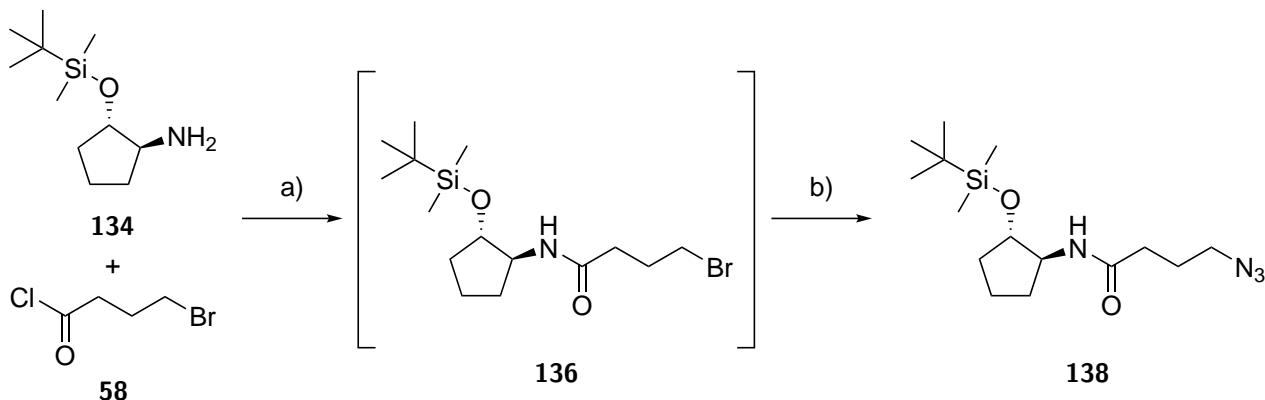

The TBDMS protected (1*S*,2*S*)-2-aminocyclopentan-1-ol **134** was reacted with 4-bromobutryryl chloride **58** to form Br-C₄-cyclopentanol-TBDMS-(SS) **136**. The reaction was observed to go to completion by TLC, it became apparent that the product was reacting further during concentration and purification. Adding sodium azide to the mixture obtained after the failed purification attempts was observed to convert the remaining Br-C₄-cyclopentanol-TBDMS-(SS) **136** to N₃-C₄-cyclopentanol-TBDMS-(SS) **138**. A sequential one-pot reaction was therefore used, so that the reactive intermediate did not need to be isolated.

Scheme 28: Attempted synthesis of Br-C₄-cyclopentanol-TBDMS-(SS) **136**. a) NaHCO₃, CH₂Cl₂, H₂O, 0 °C, 2 h.

3.5.3.3 Synthesis of N₃-C₄-cyclopentanol-TBDMS-(SS) 138 by one-pot reaction

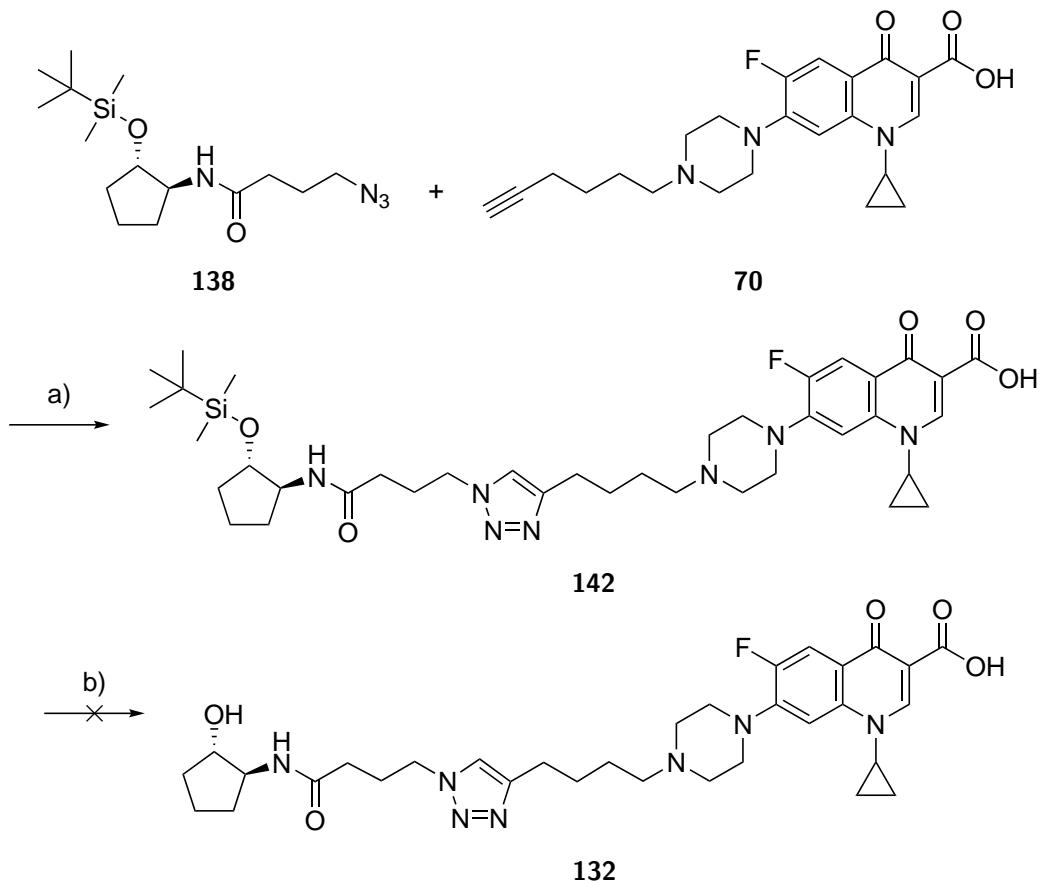

N₃-C₄-cyclopentanol-TBDMS-(SS) **138** was finally synthesised by a two-step, one-pot reaction. Schotten-Baumann conditions were used to form the bromide. The water was then removed, and DMF and sodium azide were added. N₃-C₄-cyclopentanol-TBDMS-(SS) **138** was produced in excellent yield.

Scheme 29: Synthesis of N₃-C₄-cyclopentanol-TBDMS-(SS) **138**. a) NaHCO₃, CH₂Cl₂, H₂O, 0 °C, 3 h. b) NaN₃, DMF, CH₂Cl₂, r.t., 3 h. 99.2 % over 2 steps.

3.5.3.4 Synthesis of the (SS)-TBDMS-cyclopentanol-Cip triazole conjugate **142**

N₃-C₄-cyclopentanol-TBDMS-(SS) **138** and the alkynyl ciprofloxacin derivative **70** were subjected to standard click conditions (see 4.25), and the (SS)-TBDMS-cyclopentanol-Cip triazole conjugate **142** was synthesised in very good yield. However, removal of the TBDMS group proved difficult. Deprotection using 1.5 eq. TBAF in THF proceeded slowly, reaching completion in 5 d. Increasing the amount of TBAF to 8 eq. allowed the reaction to proceed overnight. Purification of the final conjugate **132** by column chromatography was not successful due to streaking and poor separation. Purification using DOWEX resin and CaCO₃⁴⁸ was attempted, but the product could not be recovered from the resin. The purification method could probably be optimised, e.g. by varying the solvent used with the resin, but ultimately this route was abandoned due to the reduction in number of steps afforded by the two methods described below.

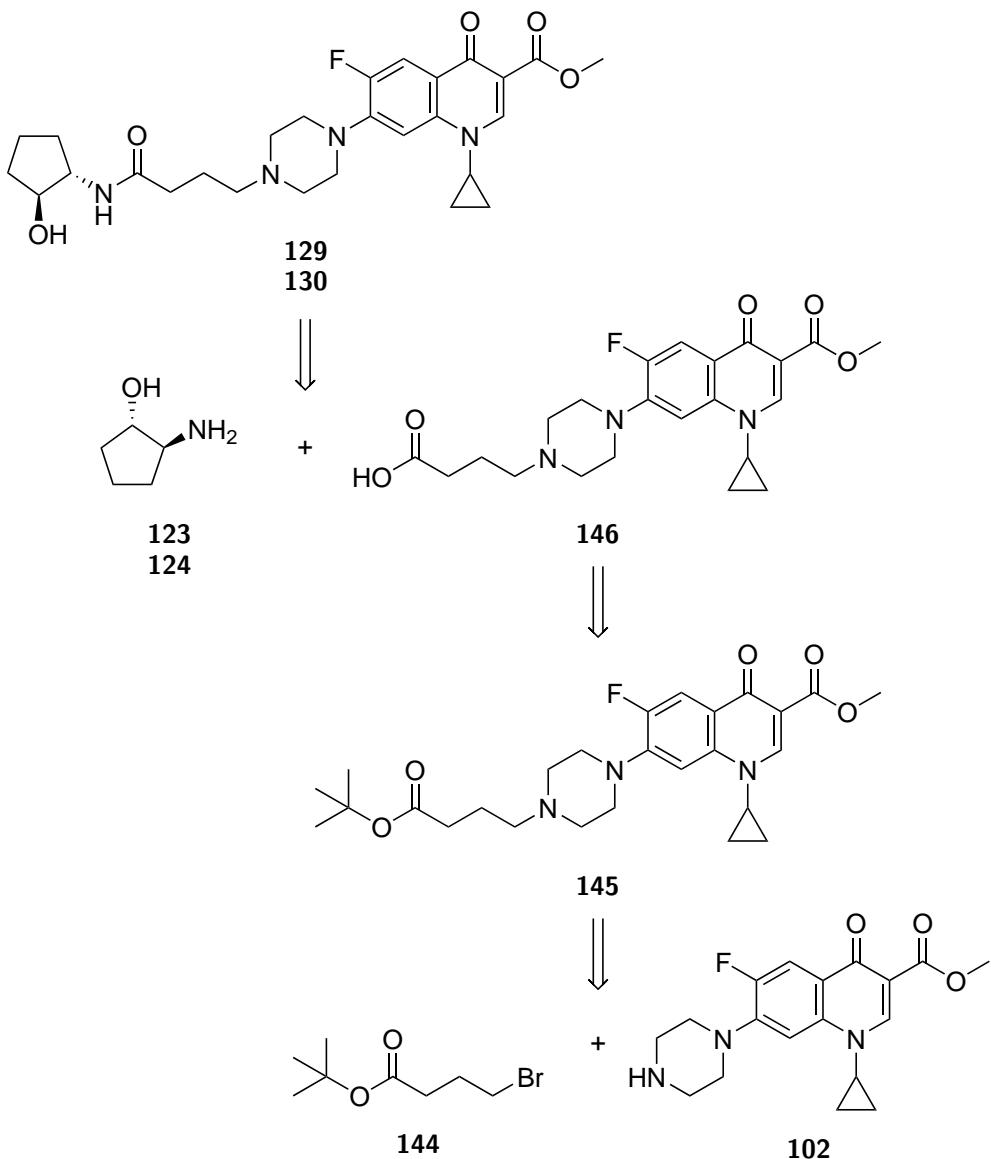

Scheme 30: Synthesis of the (*SS*)-TBDMS-cyclopentanol-Cip triazole conjugate **142**. a) CuSO_4 , sodium ascorbate, THPTA, H_2O , *t*-BuOH, r.t., 87.4 %. b) TBAF, THF, r.t., 16 h.

3.5.4 Synthesis of the cyclopentanol-CipMe conjugates **129** and **130** by peptide coupling

Given the side-reactions and low yields associated with the literate synthesis of the S_N2 conjugates proposed by Ganguly et. al,²⁶ an alternative synthesis was investigated, involving building up the linker on the ciprofloxacin side before coupling with the head group (see Scheme 31).

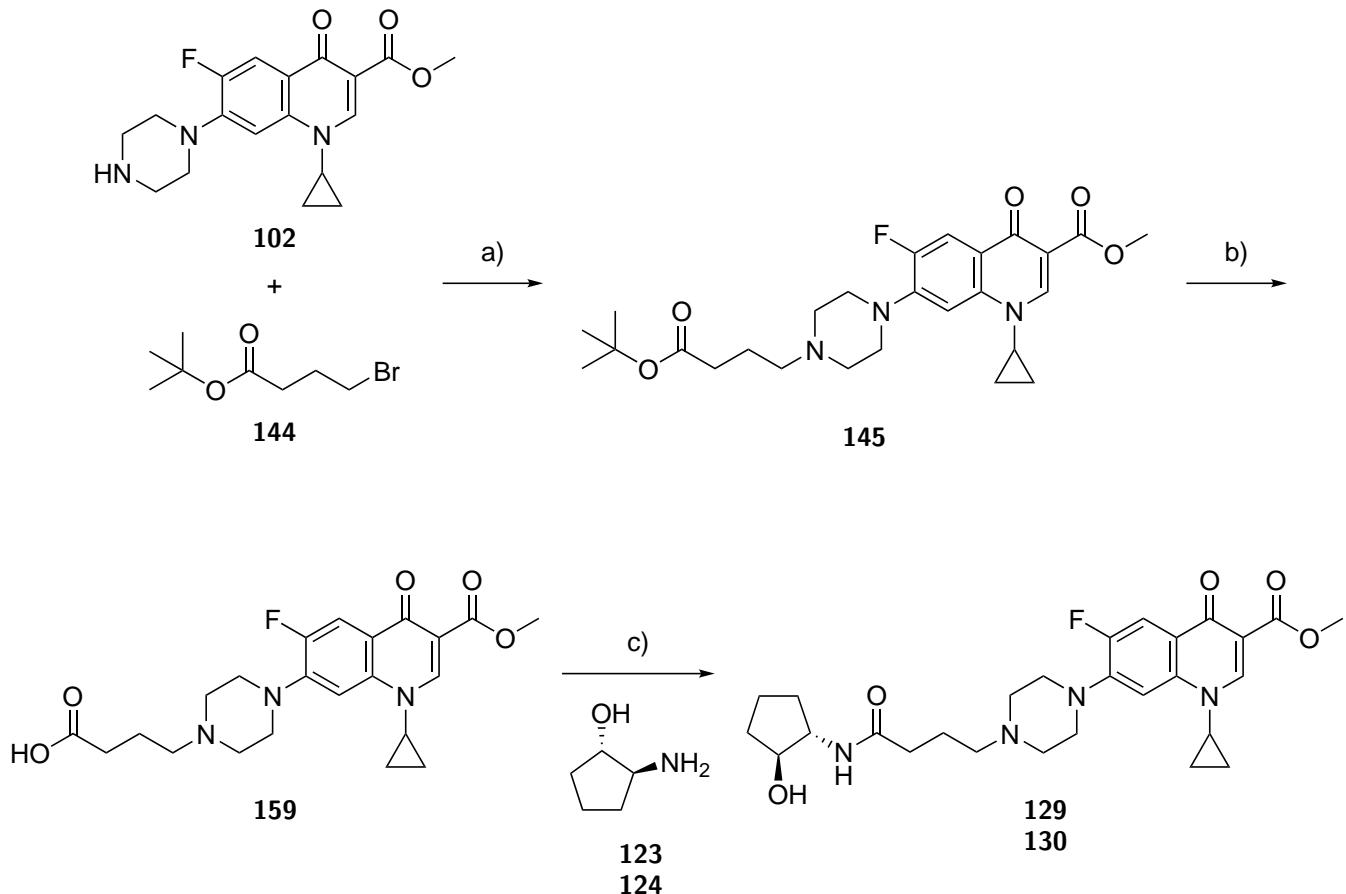

Scheme 31: Retrosynthesis of the cyclopentanol-CipMe conjugates **129** (*SS*) and **130** (*RR*). *SS* enantiomers are shown, but both will be synthesised.

The first step of the synthesis was an S_N2 reaction between Boc-protected 4-bromobutyric acid **144** methyl ciprofloxacin **102** (see Scheme 32). This reaction used fairly harsh conditions (16 h at 100 °C), but early on in the synthesis before the head group was installed. Hence the possibility of side reactions between the bromide and the amine was removed. Intermediate **145** was obtained in acceptable yield after column chromatography (49.9 %). Intermediate **145** was deprotected in excellent yield using TFA in CH_2Cl_2 to give carboxylic acid **146**. Scale-up of this reaction allowed the easy synthesis of 600 mg of this useful intermediate, which can be coupled with various amine head-groups to create a library. Carboxylic acid **146** was first coupled with (*1R,2R*)-2-aminocyclopentan-1-ol **124** using standard peptide coupling conditions to give cyclopentanol-CipMe conjugate **130**. Purification by column chromatography was attempted twice with poor results, before moving on to using preparative HPLC, which gave **130** cleanly in 38.7 % yield. Coupling was also performed with (*1S,2S*)-2-aminocyclopentan-1-ol **123** to give the enantiomer **129** in 54.7 % yield.

Direct comparisons of routes are not possible without repeating syntheses using this new method, but if it is assumed that peptide coupling of homocysteine thiolactone hydrochloride **103** to carboxylic acid **146** would have a similar yield to the coupling with (*1R,2R*)-2-aminocyclopentan-1-ol **124**, approximate comparisons can be made. The synthesis described in 3.2 has an overall yield of 10.7 %, whereas the route shown in Scheme 32

for **129** has an overall yield of 26.1 %. Moreover, if the yield starting from the head group (which may be expensive, difficult to synthesise and/or unstable) is considered, the yield is 54.7 % vs. 10.7 %. Therefore, this route is recommended for further investigation if the library is to be expanded.

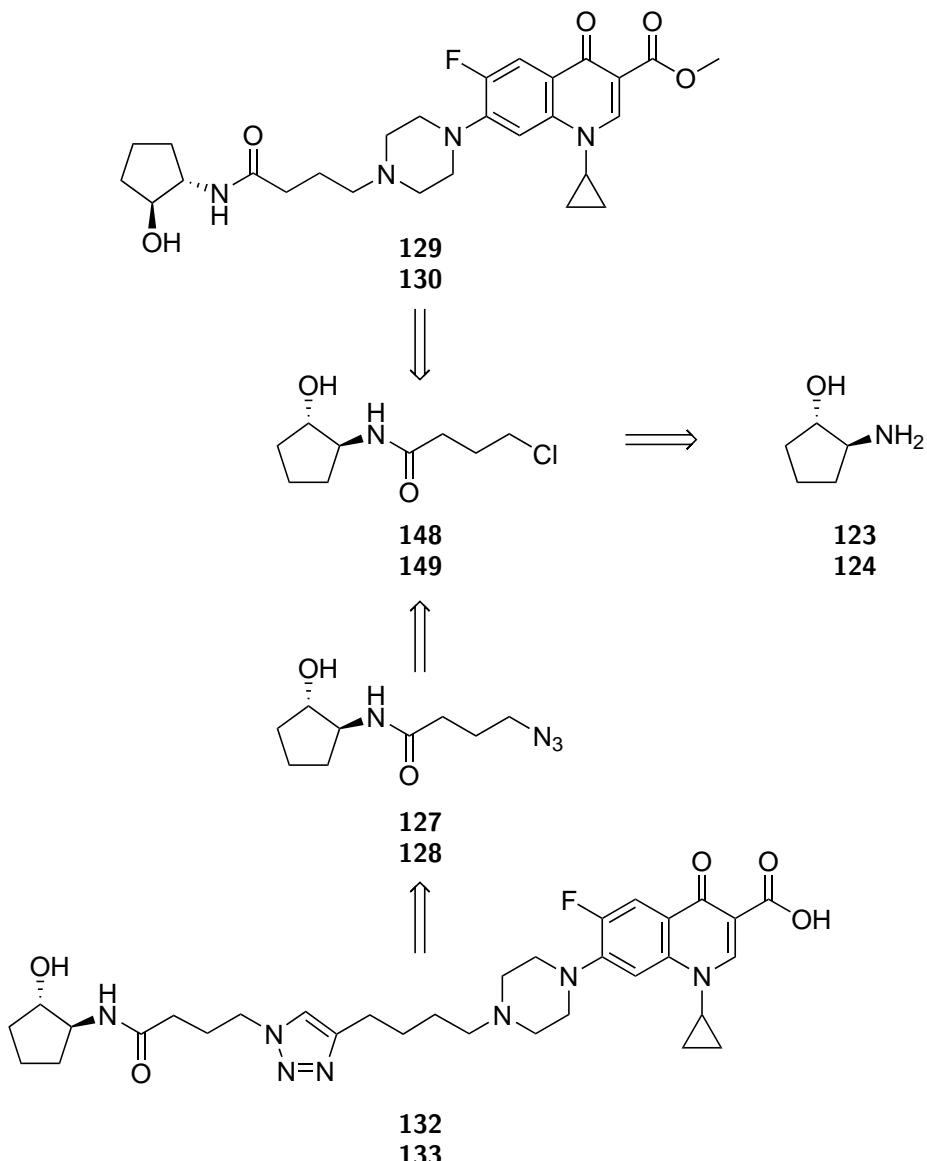

A downside to this route is that it cannot branch towards the triazole-coupled library in the same way that the route in 3.2. A carboxylic acid intermediate with a triazole in the chain could presumably be synthesised, but this would be rather pointless given that the triazole library was initially proposed so that the two sides could be joined by the 'click' reaction. Therefore, an alternative route to the azide was proposed, via a more stable chloride intermediate (see 3.6.3).

Scheme 32: Synthesis of the cyclopentanol-CipMe conjugates **129** (*SS*) and **130** (*RR*) by peptide coupling. *SS* enantiomers are shown, but both were synthesised. a) NaI, TEA, acetonitrile, 100 °C, 16 h, 49.9 %. b) TFA, CH₂Cl₂, r.t., 18 h, 95.6 %. c) EDC, HOEt, DIPEA, DMF, r.t., 16 h, **129** (*SS*): 54.7 %, **130** (*RR*): 38.7 %.

3.5.5 Synthesis of the cyclopentanol-Cip triazole conjugates **132** and **133** via chloride intermediates

A final attempt at a branching strategy was attempted, via a chloride rather than a bromide intermediate (see Scheme 33 and Scheme 24 for comparison). The bromide intermediate was initially chosen as it was used by Ganguly et. al.²⁶ but it was hoped that using a chloride would cut out some of the side reactions seen with the more reactive bromide.

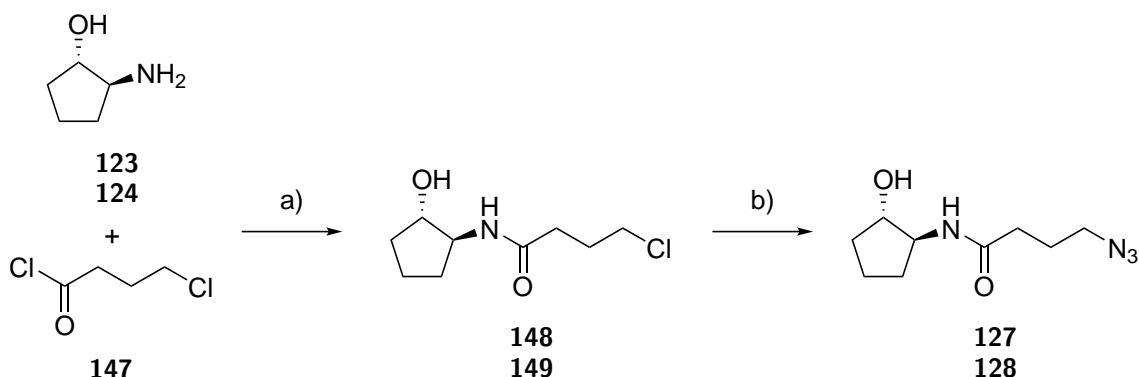

Scheme 33: Retrosynthesis of the cyclopentanol-CipMe conjugates **129** (*SS*) and **130** (*RR*), and the cyclopentanol-Cip triazole conjugates **132** (*SS*) and **133** (*RR*) via Cl-C₄-cyclopentanol intermediates **148** (*SS*) and **149** (*RR*). *SS* enantiomers are shown, but both will be synthesised.

Attempts at this route began with the synthesis of Cl-C₄-cyclopentanol-(*RR*) **149**. Standard Schotten-Baumann conditions failed to produce significant amounts of product. If prolonged reaction times were allowed, degradation of the acid chloride to the carboxylic acid was observed. The reason for this is unclear, but it is possible that bromide ions present in small amounts in previous reactions were helping to catalyse the reaction of the acid chloride. Archer *et al.*⁴⁹ propose that bromide ions can react with acid chlorides to form acid bromides, which are then more susceptible to nucleophilic attack. As no bromide ions are present in this reaction, different conditions were sought in order to increase the rate.

As (1*R*,2*R*)-2-aminocyclopentan-1-ol **124** is fairly polar, it is likely that it was staying in the aqueous layer to some extent even when deprotonated, thus keeping the two reactants apart. Therefore, the solvent system and base were changed to neat CH₂Cl₂ and TEA. This produced Cl-C₄-cyclopentanol-(*RR*) **149** in good yield (64.1 %). Unlike the bromide **125**, the chloride **149** was stable when concentrated.

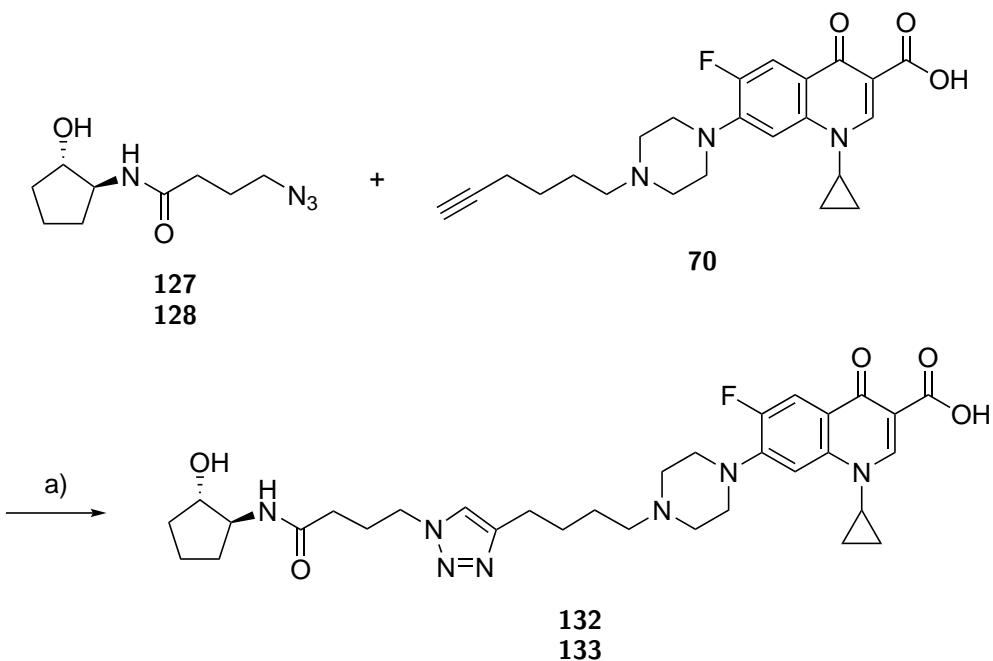

Cl-C₄-cyclopentanol-(*RR*) **149** was converted to N₃-C₄-cyclopentanol-(*RR*) **128** by reaction with sodium azide. The reaction was slower than with previous bromides (~16 h vs. ~2 h), but much cleaner than with Br-C₄-cyclopentanol-(*SS*) **125** (see 3.5.2).

The enantiomers Cl-C₄-cyclopentanol-(SS) **148** and N₃-C₄-cyclopentanol-(SS) **127** were synthesised in lower yields, in part because of the smaller amounts being used.

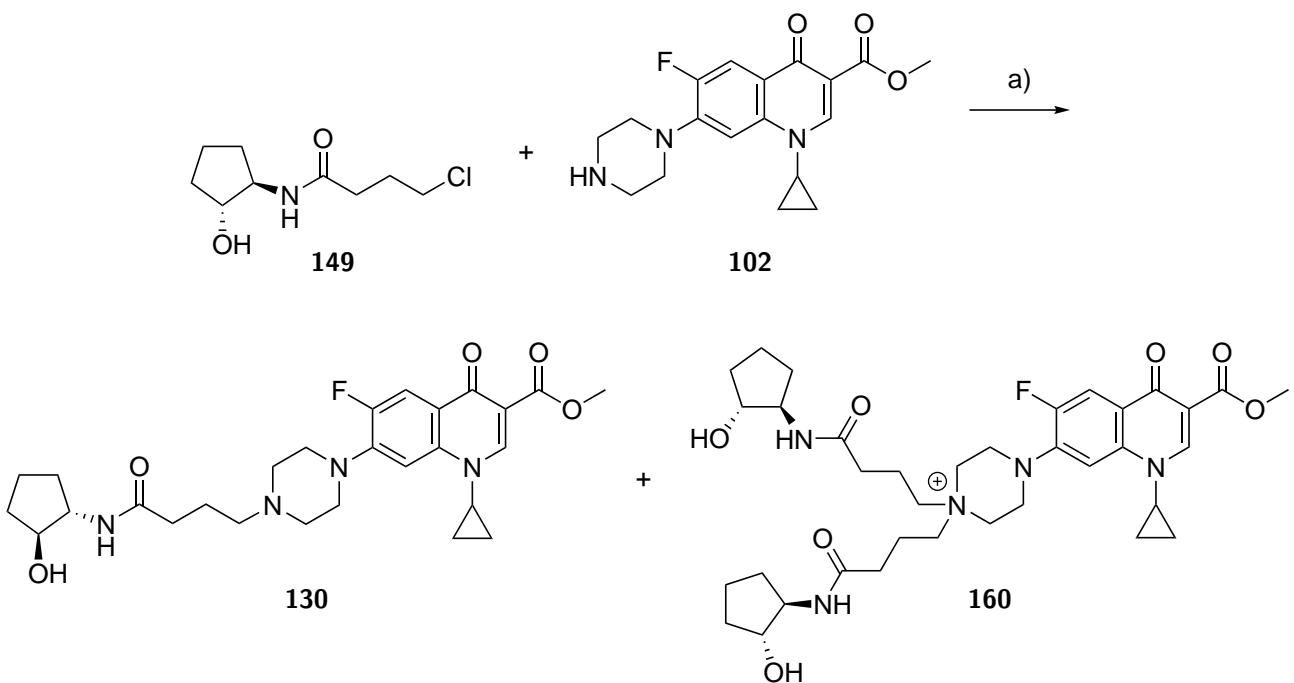

Scheme 34: Synthesis of N₃-C₄-cyclopentanol-(*SS*) **127** and N₃-C₄-cyclopentanol-(*RR*) **128**. *SS* enantiomers are shown, but both were synthesised. a) TEA, CH_2Cl_2 , 0°C , 2 h, **148** (*SS*): 24.2 %, **149** (*RR*): 64.1 %. b) NaN_3 , acetonitrile, 50°C , 16 h, **127** (*SS*): 45.0 %, **128** (*RR*): 87.6 %.

The cyclopentanol-Cip triazole conjugates **132** (*SS*) and **133** (*RR*) were synthesised using standard click conditions (see 4.25). Yields were poor primarily due to problems with purification, including losses on the preparative HPLC column and high polarity leading to losses during extraction from aqueous solvents. However, as enough of the compounds was obtained for biological testing the purification was not optimised further.

Scheme 35: Synthesis of the cyclopentanol-Cip triazole conjugates **132** (*SS*) and **133** (*RR*). *SS* enantiomers are shown, but both were synthesised. a) CuSO_4 , THPTA, sodium ascorbate, H_2O , *t*-BuOH, r.t., 16 h, **132** (*SS*): 22.2 %, **133** (*RR*): 27.1 %.

The S_N2 reaction of Cl-C₄-cyclopentanol-(*RR*) **149** and methyl ciprofloxacin **102** was attempted (see Scheme 36) using the microwave conditions described previously (see 3.3), to see if the chloride produced better results compared with the bromide. However, as was seen with the other microwave reactions, a substantial amount of the disubstituted product **159** was seen by LCMS (in an approx 1:1 ratio with the desired product **160**). As a higher-yielding route had already been found (see 3.5.4), this route was abandoned.

Scheme 36: Attempted synthesis of the cyclopentanol-CipMe-(*RR*) conjugate **130**. a) NaI , DIPEA, acetonitrile, microwave reactor, $100\text{ }^\circ\text{C}$.

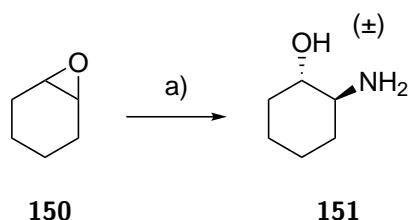

With (unfortunately not branching) routes to the $\text{S}_{\text{N}}2$ and click conjugates established (see 3.5.4 and 3.6.3 respectively), attention was turned to the cyclohexanol derivatives.

3.6 Cyclohexanol derivatives

3.6.1 Synthesis of the *trans*-2-aminocyclohexan-1-ol head group **151**

It was decided to produce the cyclohexanol conjugates racemically, with the option of re-synthesising enantiomerically pure versions via the route shown in 3.5.1 if the compounds showed biological activity.

Production of the cyclohexanol conjugates began with the synthesis of *trans*-2-aminocyclohexan-1-ol **151** (see Scheme 37), using a procedure reported by Xue *et al.*⁵⁰ Cyclohexene oxide **150** was opened using ammonia in water and methanol. Initially the reaction was carried out at $85\text{ }^\circ\text{C}$ in a microwave reactor for 30 min, but a large amount of the disubstituted amine could be seen by LCMS (in a ratio of 4:3 product to impurity by NMR). The reaction was therefore attempted at room temperature, and proceeded overnight in high yield and with minimal side reaction.

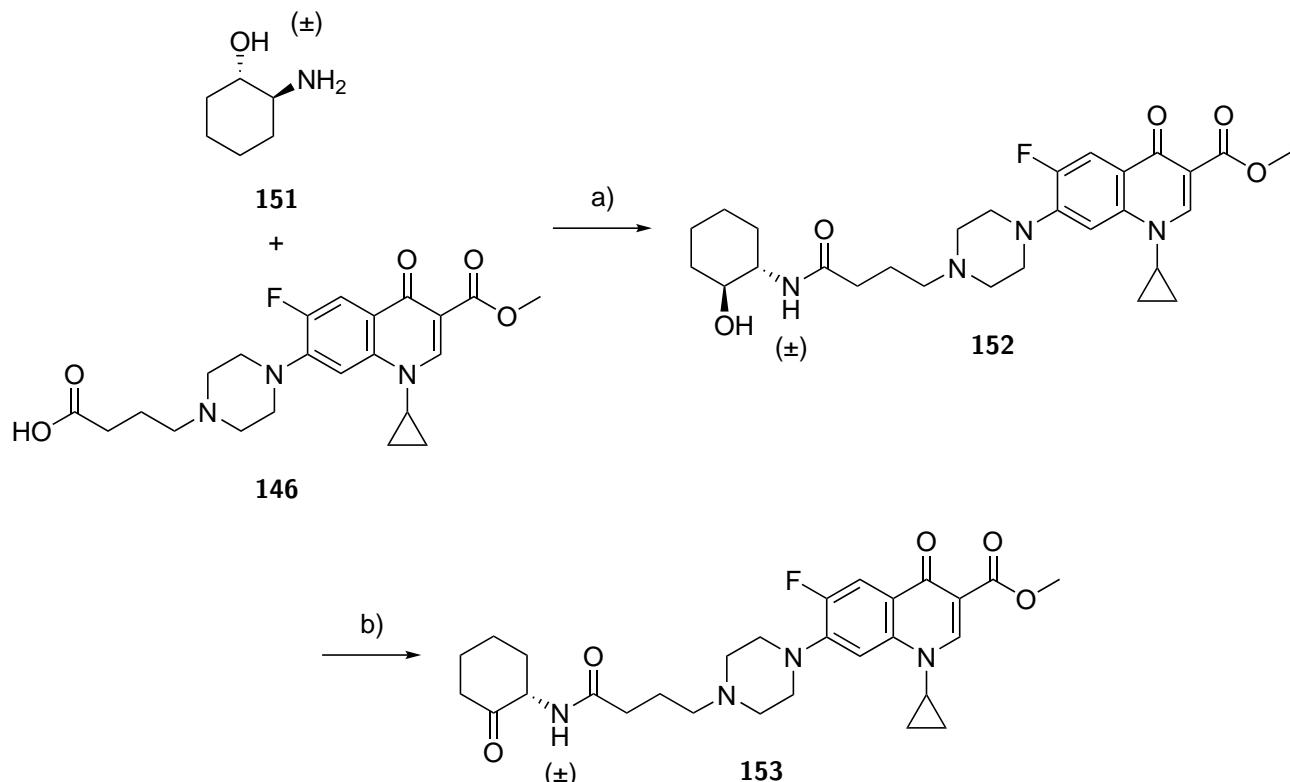

Scheme 37: Synthesis of *trans*-2-aminocyclohexan-1-ol **151**. a) NH_3 , water, MeOH , r.t., 72 h, 86.2 %.

3.6.2 Synthesis of the *trans*-cyclohexanol- and cyclohexanone-CipMe conjugates 152 and 153

Carboxylic acid **146** was coupled with *trans*-2-aminocyclohexan-1-ol **151** using standard peptide coupling conditions to give *trans*-cyclohexanol-CipMe conjugate **152** in 31.7 % yield. Again, losses during purification appear to be the main cause of this poor yield.

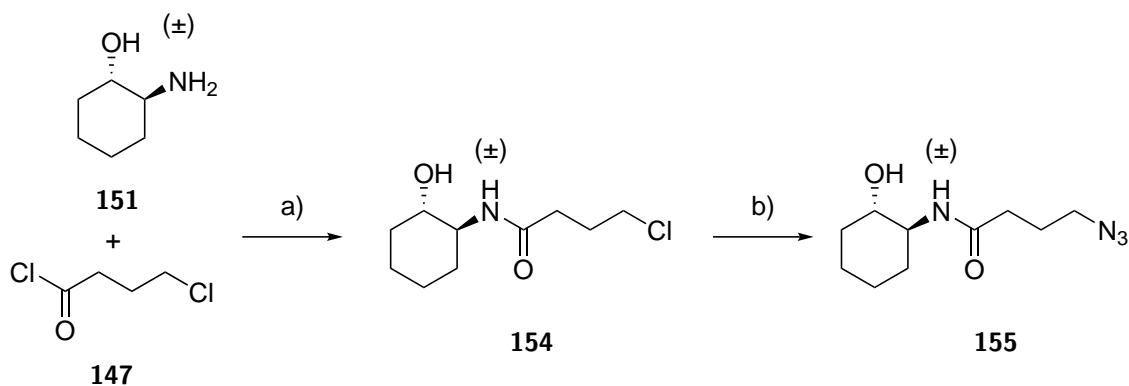

A portion of the *trans*-cyclohexanol-CipMe conjugate **152** was then oxidised to the ketone using Dess-Martin periodinane. The product was isolated in good yield, perhaps due to the compound being less polar and hence easier to purify.

Scheme 38: Synthesis of the cyclohexanol-CipMe conjugate **152** and the cyclohexanone-CipMe conjugate **153**.
a) EDC, HOBr, DIPEA, DMF, r.t., 16 h, 31.7 %. b) DMP, CH_2Cl_2 , r.t., 6 h, 69.1 %.

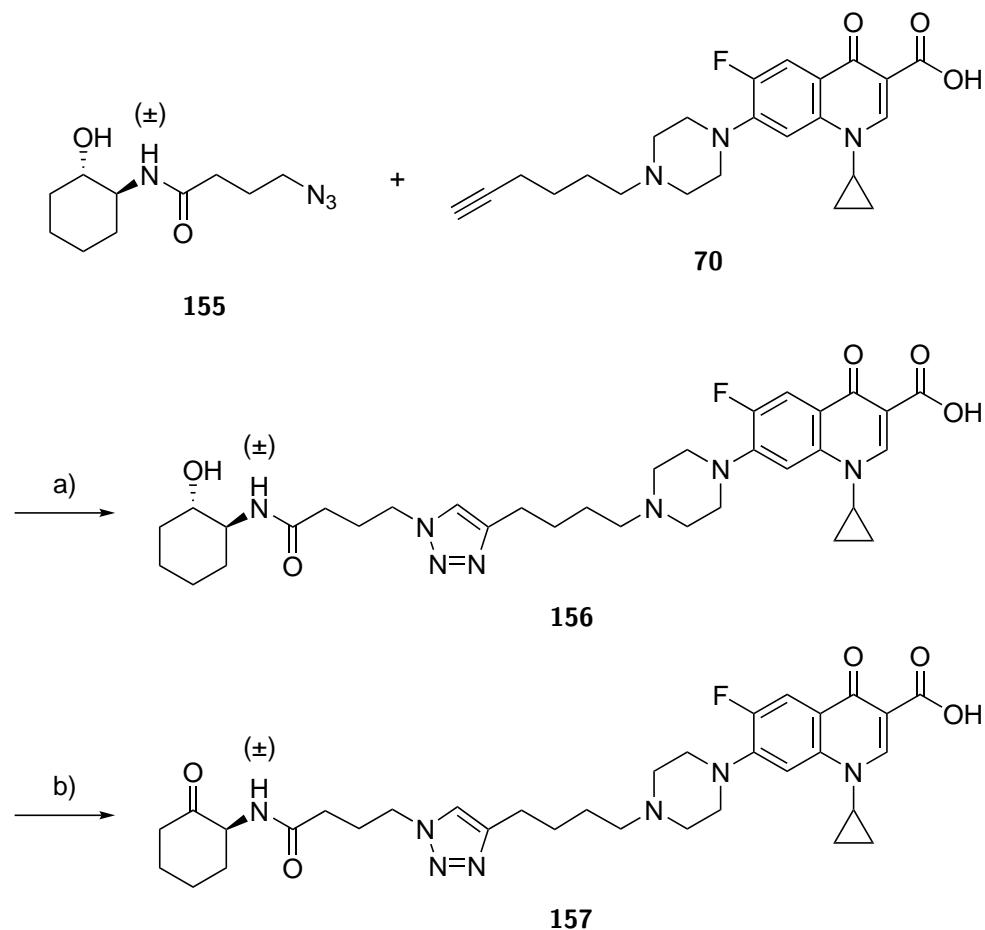

3.6.3 Synthesis of the *trans*-cyclohexanol- and cyclohexanone-Cip triazole conjugates **156** and **157**

The triazole conjugates were synthesised using the route described in . Cl-C_4 -*trans*-cyclohexanol **154** was synthesised in good yield from *trans*-2-aminocyclohexan-1-ol **151** and 4-chlorobutyryl chloride **147**. Cl-C_4 -*trans*-cyclohexanol **154** was then converted to $\text{N}_3\text{-C}_4$ -*trans*-cyclohexanol **155** by reaction with sodium azide in excellent yield.

Scheme 39: Synthesis of *N*₃-C₄-*trans*-cyclohexanol **155**. a) TEA, CH₂Cl₂, 0 °C, 30 min, 76.1 %. b) NaN₃, acetonitrile, 50 °C, 16 h, 97.5 %.

The *trans*-cyclohexanol-Cip triazole conjugate **156** was synthesised using standard click conditions (see 4.25) in 48.9 % yield. A portion of the *trans*-cyclohexanol-Cip conjugate **156** was then oxidised to the ketone using the same conditions used for the cyclohexanone-CipMe conjugate (see 3.6.2) in very good yield.

Scheme 40: Synthesis of the *trans*-cyclohexanol-Cip triazole conjugate **156** and the cyclohexanone-Cip triazole conjugate **157**. a) CuSO₄, THPTA, sodium ascorbate, H₂O, *t*-BuOH, r.t., 16 h, 48.9 %. b) DMP, CH₂Cl₂, r.t., 4 h, 78.0 %.

4 Experimental

4.1 General

Unless otherwise stated, reactions were performed in air-dried glassware under argon with dry, freshly distilled solvents. THF was distilled from LiAlH₄ in the presence of triphenyl methane indicator. CH₂Cl₂, hexane, MeOH and MeCN were distilled from calcium hydride. All other chemicals were used as obtained from commercial sources.

Reactions using microwave heating were performed in sealed vials using a CEM Discover SP microwave reactor.

Thin Layer Chromatography (TLC) was performed using Merck pre-coated 0.23 mm thick plates of Keisel-gel 60 F254 and visualised using UV ($\lambda = 254$ or 366 nm) or by staining with KMnO₄ or ninhydrin. All retention factors (R_f) are given to 0.01. All column chromatography was carried out using Merck 9385 Keisel-gel 60 silica gel (230-400 mesh) or using a CombiFlash® EZ Prep with RediSep® normal-phase silica flash columns. Preparative High Pressure Liquid Chromatography was run on an Agilent 1260 Infinity machine, using a Supelcosil™ ABZ+PLUS column (250 mm × 21.2 mm, 5 μm) with a linear gradient system (solvent A: 0.1 % (v/v) TFA/water, solvent B: 0.05 % (v/v) TFA/acetonitrile) at a flow rate of 20 mL min⁻¹, visualised by UV absorbance ($\lambda_{max} = 254$ nm)

Nuclear Magnetic Resonance (NMR) spectra were recorded using an internal deuterium lock at ambient probe temperatures on Bruker DPX-400, Bruker Avance DRX-400, Bruker Avance 500 BB-ATM or Bruker Avance 500 Cryo Ultrashield spectrometers. Data were processed using NMR Processor Academic Edition version 12 (ADC Labs) or TopSpin version 3.5 (Bruker). ¹H and ¹³C spectra were assigned using DEPT, COSY, HMQC and HMQC spectra where necessary, or by analogy to fully interpreted spectra of related compounds. The following abbreviations are used to indicate the multiplicity of signals: s singlet, d doublet, t triplet, q quartet, quin quintet, m multiplet and br broad.

¹H chemical shifts (δ) are quoted to the nearest 0.01 ppm and are referenced relative to the residual solvent peak.⁵¹ Coupling constants (J) are given to the nearest 0.1 Hz. Diastereotopic protons are assigned as CHH and CH_H, where the latter designates the lower-field proton. Data are reported as follows: <chemical shift> (<multiplicity>, <coupling constant(s)> (if any), <integration>, <assignment>).

¹³C chemical shifts (δ) are quoted to the nearest 0.1 ppm and are referenced relative to the deuterated solvent peak.⁵¹ Data are reported as follows: <chemical shift> (<multiplicity (if not s)>, <coupling constant(s)> (if any), <assignment>).

¹⁹F chemical shifts (δ) are quoted to the nearest 0.1 ppm. Data are reported as follows: <chemical shift> (<assignment>).

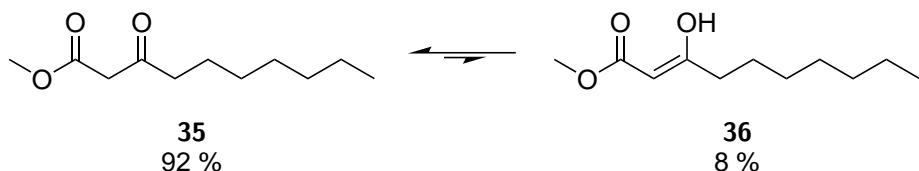

High Resolution Mass Spectra (HRMS) were recorded using a Micromass LCT Premier spectrometer or a Waters Vion IMS-QTOF spectrometer and reported mass values are within ± 5 ppm mass units. Low Resolution Mass Spectra (LRMS) were recorded on an Agilent 1200 series LC with an ESCi Multi-Mode Ionisation Waters ZQ spectrometer or a Waters ACQUITY H-Class UPLC with an ESCi Multi-Mode Ionisation Waters SQD2 mass spectrometer.

Infra Red (IR) spectra were recorded using neat sample on a PerkinElmer 1600 FT IR spectrometer. Selected absorption maxima (ν_{max}) are reported in wavenumbers (cm⁻¹). Broad peaks are marked br.

Melting points (m.p.) were measured using a Buchi B-545 melting point apparatus and are uncorrected.

Optical rotations ([α]_D^T) were recorded on a PerkinElmer 343 polarimeter or an Anton-Paar MCP 100 polarimeter. [α]_D^T values are reported in °10⁻¹cm²g⁻¹ at 589 nm and concentration (c) is given in g (100 mL)⁻¹.

4.2 Methyl 3-oxodecanoate 35

Meldrum's acid **33** (9.0 g, 63 mmol, 1 eq.) was dissolved in anhydrous CH_2Cl_2 (150 ml) in an oven-dried flask and cooled to 0 °C. Pyridine (10.2 ml, 126 mmol, 2 eq.) was added dropwise over 20 min. Octanoyl chloride **34** (11.7 ml, 69 mmol, 1.1 eq.) was then added and the mixture was stirred at 0 °C for a further 4 h. The mixture was allowed to warm to r.t., diluted with CH_2Cl_2 (20 ml) and poured into a mixture of ice (~30 g) and HCl (2 N, 90 ml). The solution was washed with NaCl (sat., aq., 150 ml) and dried over MgSO_4 . The solvent was removed under vacuum to give an orange-brown oil. The oil was refluxed in anhydrous MeOH (150 ml) for 5 h and the solvent was removed under vacuum. The resulting residue was purified by column chromatography (SiO_2 , 5 % Et₂O/40-60 P.E.). A tautomeric mixture of **35** and **36** was obtained as a colourless oil (8.34 g, 41.6 mmol, 66 %, 92 % **35** as determined by ¹H NMR).

4.6 Heptyl magnesium bromide 42

Magnesium turnings (352 mg, 14.5 mmol, 1 eq.) were added to an oven-dried flask under argon. THF (15 ml) was added, followed by bromoheptane **41** (2.40 ml, 14.5 mmol, 1 eq.) dropwise. The mixture was stirred at r.t. for 2 h followed by heating to reflux for 2 h. Heptyl magnesium bromide **42** was obtained as a pale grey suspension (15 ml, ~ 1 M) which was used without further purification.

4.7 2-Chloro-*N*-methoxy-*N*-methylacetamide 45

N,O-Dimethylhydroxyl amine hydrochloride **43** (6.00 g, 61.5 mmol, 1 eq.) and toluene (75 ml) were added successively to a stirred solution of potassium carbonate (22.4 g, 162 mmol, 2.63 eq.) in water (75 ml) at 0 °C under argon. The mixture was cooled to - 5 °C and chloroacetyl chloride **44** (5.88 ml, 73.8 mmol, 1.20 eq.) was added dropwise over 5 min. The mixture was allowed to warm to r.t. over 30 min, then the organic layer was separated and the aqueous layer was extracted with toluene (3×20 ml). The combined organic extracts were dried with MgSO₄ and the solvent was removed by rotary evaporation followed by high vacuum. **45** was obtained as white, prism-like crystals (7.24 g, 52.6 mmol, 71 %).

mp T / °C = 38.8 (toluene)

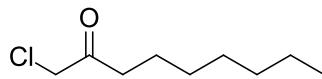

IR (neat) ν_{max} / cm⁻¹ = 3016.7 (C-H), 2966.4 (C-H), 2946.7 (C-H), 2827.7 (C-H), 1666.2 (C=O)

4.25 Optimised general procedure for the click reaction

Azide (1 eq.) and alkyne (1 eq.) were dissolved in 50 % *t*-BuOH/water in a round-bottomed flask with a stirrer bar, closed with a *new* septum. The mixture was degassed by bubbling through N₂. The mixture was placed under positive pressure  or using a balloon. Equimolar amounts of CuSO₄ · 5 H₂O and THPTA **76** were dissolved in similar water to make a 50 mM solution and similarly degassed. Sodium ascorbate was dissolved in water to make a 100 mM solution and similarly degassed. The Cu/THPTA solution (0.05 eq.) was added to the reaction mixture, followed by the sodium ascorbate solution (0.1 eq.). The mixture was stirred for 2 h and monitored using LCMS. HL derivative conjugates were dry-loaded onto SiO₂ and purified by column chromatography (SiO₂, 0-20 % MeOH/CH₂Cl₂). Other conjugates were purified by preparative HPLC (5-95 % acetonitrile (0.1 % TFA)/water (0.05 % TFA) over 20 min).

4.26 (*S*)-1-Cyclopropyl-6-fluoro-4-oxo-7-(4-(4-(1-(2-oxo-2-((2-oxotetrahydrofuran-3-yl)amino)ethyl)-1*H*-1,2,3-triazol-4-yl)butyl)piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid **74**

50 % water/*t*-BuOH (2 ml) was degassed by bubbling N₂ through it. This was then added to a mixture of 1-cyclopropyl-6-fluoro-7-(4-(hex-5-yn-1-yl)piperazin-1-yl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid **70** (20.6 mg, 50.0 μ mol, 1 eq.) and (*S*)-2-azido-*N*-(2-oxotetrahydrofuran-3-yl)acetamide **57** (9.2 mg, 50.0 μ mol, 1 eq.). A similarly degassed solution of CuSO₄ · 5 H₂O (624 μ g, 2.5 μ mol, 0.05 eq. 50 mM), THPTA (1.09 mg, 2.5 μ mol, 0.05 eq. 50 mM) and sodium ascorbate (991 μ g, 5 μ mol, 0.1 eq., 100 mM) in 50 % water/*t*-BuOH (50 μ l) was then added. The mixture was stirred at r.t. under argon for 3 h. On observation that the reaction had stalled, the reaction was degassed again, and a further portion of catalyst solution (50 μ l) was added. After a further 3 h the reaction mixture was dry-loaded onto SiO₂ and purified by column chromatography using a Combiflash (SiO₂, 0-20 % MeOH/CH₂Cl₂ over 15 min). The combined pure fractions were dried with MgSO₄ and evaporated under reduced pressure. **74** was obtained as a white amorphous solid (8.8 mg, 14.8 μ mol, 29.6 %).

4.27 (*S*)-1-Cyclopropyl-6-fluoro-4-oxo-7-(4-(4-(1-(4-oxo-4-((2-oxotetrahydrofuran-3-yl)amino)butyl)-1*H*-1,2,3-triazol-4-yl)butyl)piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid 79

50 % water/*t*-BuOH (2 ml) was degassed by bubbling N₂ through it. This was then added to a mixture of 1-cyclopropyl-6-fluoro-7-(4-(hex-5-yn-1-yl)piperazin-1-yl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid **70** (20.6 mg, 50.0 μ mol, 1 eq.) and (*S*)-4-azido-*N*-(2-oxotetrahydrofuran-3-yl)butanamide **60** (10.6 mg, 50.0 μ mol, 1 eq.). A similarly degassed solution of CuSO₄ · 5 H₂O (624 μ g, 2.5 μ mol, 0.05 eq. 50 mM), THPTA (1.09 mg, 2.5 μ mol, 0.05 eq. 50 mM) and sodium ascorbate (991 μ g, 5 μ mol, 0.1 eq., 100 mM) in 50 % water/*t*-BuOH (50 μ l) was then added. The mixture was stirred at r.t. under argon for 3 h, then dry-loaded onto SiO₂ and purified by column chromatography using a CombiFlash (SiO₂, 0-20 % MeOH/CH₂Cl₂ over 15 min). The combined pure fractions were dried with MgSO₄ and evaporated under reduced pressure. **79** was obtained as a white amorphous solid (14.6 mg, 23.4 μ mol, 46.8 %).

HRMS (ESI⁺) m/z / Da = 531.2083, [M+H]⁺ found, [C₂₆H₃₂FN₄O₅S]⁺ requires 531.2077

The compound has been synthesised previously.^{26,27} Only HRMS characterisation was published, and this agrees with the result above.

4.37 4-Azido-N-(2-oxotetrahydrothiophen-3-yl)butanamide **106**

4-Bromo-N-(2-oxotetrahydrothiophen-3-yl)butanamide **104** (6.00 g, 27.0 mmol, 1 eq.) and Na₃N (3.51 g, 54.1 mmol, 2 eq.) were refluxed in acetonitrile (120 ml) for 1.5 h. The solvent was evaporated under reduced pressure and the residue was partitioned between water (150 ml) and CH_2Cl_2 (150 ml). The aqueous layer was extracted twice more with CH_2Cl_2 (2×150 ml) and the combined organic fractions were dried with MgSO₄ and evaporated under reduced pressure. **106** was obtained as a yellow, sticky solid (4.60 g, 20.1 mmol, 89.3 %).

TLC $R_f = 0.19$ (50 % EtOAc/PE)

IR (neat) ν_{max} / cm⁻¹ = 3285.6 (N-H), 2963.9 (C-H), 2100.2 (azide), 1697.4 (thiolactone C=O), 1647.4 (amide C=O)

HRMS (ESI⁺) m/z / Da = 251.0565, [M+Na]⁺ found, [C₈H₁₂N₄NaO₂S]⁺ requires 251.0573

The compound has not been reported previously.

4.38 1-Cyclopropyl-6-fluoro-4-oxo-7-(4-(4-(1-(4-oxo-4-((2-oxotetrahydrothiophen-3-yl)amino)butyl)-1*H*-1,2,3-triazol-4-yl)butyl)piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid 107

1-Cyclopropyl-6-fluoro-7-(4-(hex-5-yn-1-yl)piperazin-1-yl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid **70** (15 mg, 36.7 μ mol, 1 eq.) and 4-azido-N-(2-oxotetrahydrothiophen-3-yl)butanamide **106** (12.5 mg, 55.1 μ mol, 1.5 eq.) were dissolved in 1:9:10 water/t-BuOH/DMSO (3 ml), and the mixture was degassed by bubbling N₂ through it. A solution of CuSO₄ and THPTA (182 μ l, 18.2 μ mol, 0.5 eq. 100 mM, aq.) was added, followed by a solution of sodium ascorbate (367 μ l, 36.7 μ mol, 1 eq., 100 mM, aq.). The mixture was stirred at r.t. under argon for 4 d. Water (10 ml) and 10 % *i*-PrOH/CHCl₃ (10 ml) were added, the organic layer was separated and the aqueous layer was extracted again with 10 % *i*-PrOH/CHCl₃ (2×10 ml). The combined organic layers were dried with MgSO₄ and evaporated under reduced pressure. The residue was purified by preparative HPLC (5-95 % acetonitrile/water over 20 min). The combined pure fractions were evaporated under reduced pressure and then partitioned between NaHCO₃ (aq., sat., 50 ml) and 10 % *i*-PrOH/CHCl₃ (50 ml). The organic layer was dried with MgSO₄ and evaporated under reduced pressure. **107** was obtained as a white amorphous solid (16.5 mg, 25.9 μ mol, 70.6 %).

4.48 (1*S*,2*S*)-2-(((*S*)-1-Phenylethyl)amino)cyclopentan-1-ol **121 and (1*R*,2*R*)-2-((*S*)-1-phenylethyl)amino)cyclopentan-1-ol **122****

(*S*)-1-Phenylethan-1-amine **120** (7.85 ml, 7.38 g, 60.9 mmol, 1 eq.) was dissolved in CH₂Cl₂ (50 ml) and stirred rapidly at 0 °C. A solution of AlMe₃ (31 ml, 2.0 M in heptane, 60.9 mmol) was added dropwise and the mixture was stirred at 0 °C for 1 h. A solution of cyclohexene oxide **119** (5.71 ml, 5.50 g, 65.4 mmol, 1.1 eq.) in CH₂Cl₂ (50 ml) was then added dropwise, and the mixture was stirred at 0 °C for a further 3 h, followed by 48 h at r.t.. The mixture was cooled to 0 °C and NaF (11 g, 262 mmol, 4.3 eq.) was added portionwise, followed by water (7.00 ml, 7.00 g, 389 mmol, 6.4 eq.) and CH₂Cl₂ (50 ml). The suspension was allowed to warm to r.t. and stirred for 1 h, then filtered through Celite and washed with CH₂Cl₂ (500 ml). The filtrate was dried with K₂CO₃, concentrated under reduced pressure and purified by column chromatography (SiO₂, 20:5:1 hexane:EtOAc:TEA). **122** was obtained as a pale yellow oil (4.08 g, 19.9 mmol, 32.6 %). **121** was obtained as pale yellow crystals (4.48 g, 21.8 mmol, 35.8 %).

Todo list

It doesn't kill Staph A...	11
put intro in intro	16
weigh Y4Tri then discuss	17
ref	20
link this up	24
link this up	25
should I show the synthesis?	25
show compounds it's in and describe?	25
read these again, put ones I didn't do in further work	26
check Boursier2018 for print publication details	27
????	54

don't have?	57
don't have?	57
try?	57
works in LCMS see Lois283	76
remove unless very active as not fully characterised	94
